my, refusing to debate over what is obviously a very thorny and
legitimate Mac issue, aren't we, TiFKAS? Which explains your cowardice
over wanting to face it.

and speaking of which, here's another post agreeing with George's
post - from someone within CompUSA. Which gives a more accurate
description of what's going on in the trenches, in contrast to your
constant Steve Jobs Reality-Distortion Field proliferation....

George Graves wrote:

<snipped only because of space, even though it should be read again>

Let me speak from the other side of the counter. Just to make things interesting, I work at my local CompUSA. With the standard disclaimer that my opinions are mine and no one else's, let me share my views on your experiences.

First off, you are 100% correct. Apple needs to solve some SERIOUS customer service issues if they ever want to get ahead. But if you think that it's bad on the customer, I'll give you some insight as to how it is for the dealer.

Let's start with the pre-sale and the sale of the machine. For historical significance, we're talking one week ago (Friday). You walk up to me, we spend about 1/2 hour talking about various configurations of Yosemite, and then you decide you wish to purchase. I remind you for the 3d or 4th time that there is no modem in the machine - and although we expect that Apple is going to release an aftermarket modem, DVD and Zip kit for the G3, we have nothing currently in stock or on order. You say ok, take the 400 and walk out of the store.

Next day comes in customer #2 (now Saturday). This person asks pretty much the same questions and I admonish the same warnings. They are so pissed at ME that they walk out of the store. In their minds, it was MY fault that Apple doesn't offer the parts yet. I'm frustrated, so I go and call Apple. I find out that Apple is "working" on a modem kit, but that there is no release date. So I get curious and check the part # and pricing for a replacement iMac modem (as I was told that they are basically the same thing). Apple tells me they are $300 as replacement parts (3x the cost of the Apple modem kit) and that they don't come with any drivers or instruction manuals. Customer #3 comes in and gets the 400 based on the information that I provide that Apple SAYS they are going to release the modem soon.

By Monday, Apple announces the part number. (Would it have been too big a deal for the Apple person to tell me that they were coming out in 2 days - or am I really to believe that Reseller Support doesn't know product availability that close to release?) Every customer who comes in this week and talks to me about the machine is told that the modems are coming, and I even provide them the Apple part # (M7405LL/A, if you're interested). I also advise that they order one via Apple, as it may get to them sooner than if they wait for the to get to the stores.

Customer #2 comes back. I know (as he does) that he wants the machine, and I can now tell him that the modems are coming. No apology - still pissed that we don't have them in stock.

OK... so now the machine is sold. The customer wants memory. I'm not sure about any of you, but iMac RAM, IMHO, is goofy. Manufacturers who make it don't even follow a specific standard when it comes to total dimensions, and

this is a problem when there isn't the same wiggle room on the bottom iMac slot that there is on the top. So I've had to turn away several customers because we don't have the right SIZE of the right RAM. As for Yosemite, PC100 was supposed to be common. But, and I know this doesn't have to do too much with Apple, there aren't any PC100 128 or 256MB chips in our store. I had a customer as for a 1/2GB of RAM upgrade and I couldn't give it to him.

So anyway, we also don't have any of the bezels for Zip drives and we sure as heck don't have any DVD drives or modems yet. So we turn people away - and the customer isn't mad at Apple - they're mad at CompUSA.

What can we do about this?

BTW, we only yesterday received any of the USB mice, keyboards and joysticks that have been on the market for a few months now. Additionally, we've never carried the iPrint, uSCSI or any of the other adapters necessary to connect an iMac with old devices (except for the HP and Epson printer adapters). Again, CompUSA looks foolish - and we continue to tick off Mac users (especially THIS mac user).

OK... sorry to vent. Hope I gave SOME useful information.

-Jeff

I don't understand. First you state that the Rage 128 chipset is not used in
the iMac (which is true) and then that "...it is stunted by the iMac['s] 33MHz
PCI bus." BTW, I don't think that it is reasonable to expect that iMac to use
the Rage 128. The cost, to consumers, of the Fury is $200 so lets assume that
Apple can get it for $150. That is about 15% of the cost of the iMac. What
Apple should do is make a gMac with a better graphics system and faster
processor. They could charge $300 more for it.

Brian,
I never meant to lead you to believe the ATI Nexus 128 was a standard item for the iMac. It is an available for purchase through third party vendors like me for the iMac. (It happens to be ATI's best Mac offering) . You idea for a gMac is great but if you were to build a graphics based machine (from a professional standpoint) You might want a graphics engine based around HEIDI and openGL not just openGL. For this you would be talking some very serious change , on the order of $500.00 to $1500.00
just for the graphics card.

Harold
PS when are we going to start talking Atari in the newsgroup again.

Can people stop talking Mac in here and get back to Atari? If you want
to talk Mac, then by all means go to a Mac newsgroup or private mail.

I know that you people in North America get free local phone calls,
but in other parts of the world we have to pay for them, and unwanted
(long) posts about other machines in an ATARI newsgroup are just not
wanted.

Thankyou.

Cheers!

James

I agree. Now the altered topic should be of interest to most Falcon (AWA TT owners) and future possible Milan owners. I suggest that anyone really interested in the new clones search around the web for other applications of the 68040 and 68060 to see what is available. I found several interesting sites, one where a guy built his own MC 68060 motherboard. Another is a site where a 68060 PCI card is in the works to run Mac O/S on a PC. Dual 68060's on VME cards. The Mars Rover used 060's.

Seems like an interesting topic. If vendors can produce fine hardware for other makes of computers, then it shouldn't be so hard for these visiting experts to explain how we can adapt them to our systems. After all, we die hards will never purchase a new G3, so they can just give up and help out, or get out.

Wake up Harold. This is comp.sys.atari.ADVOCACY
Without TIKAS and his sidekick, bugger all would be happening here.
I enjoy being offended by TIFKAS.

However two things are clear in the recent weeks.

1ST is DAN accepted defeat in G3 vs Milan.
2ND is TIKAS avoids all customer service questions posted by Dan, just as
he probably avoids his own customers problems:-).
However none of this banter affects me and my humble 520ST from being the
cheapest internet machine going.
3rd With iCAB coming out for Macs for a PRICE, perhaps older Macs can do some
thing useful on the internet, like older Ataris, otherwise why did ASH even
bother no one would buy a browser when better ones are FREE. Unless of course
you read the papers saying that buying a CD of the latest Netscape is worth
the price vs downloading it. Sure it is:-).

Finally Harold, I don't believe your post was even sent via an Atari.
A true Jihad would be beaten to death for this indescrection.

Later Brian.

Brian
I happen to be typing on an Atari PC5. I have personally utilised Atari computers since my first 400 in 1980 Since then I have owned and used the 800, 800xl, 1200xl, 130xegm, 520 ST, mega 4. mega STe 4, TT/system V, ABC 386, Atari PC5. not to mention my 2600,7800, Jaguar/CD, Lynxes, and Touch Me. The best part is I still own all of these machines and use them. The fact is I couldn't be more Atari oriented, all the way down to the Fuji on my Jeep.
Lastly the G3 vs. Milan comparison isn't fair because you are not comparing equivalent machines. Lastly the price issue is moot. Sure Apple can sell the iMac for less they manufacture many, many more.

3385. A-ONE... A New Atari Online Magazine

Newsgroup: comp.sys.atari.advocacy
Date: 1999-02-21 00:00:00 UTC
From: jmirando@portone.com
Message-ID: <7apa4p$7pj$5@remarQ.com>
Source record: 3748

For Immediate Release

Former Atari Editors to Debut New Online Magazine

[February 19, 1999, Boston] Former STReport Atari Editors Dana Jacobson and Joe Mirando announced today that they have begun work on a new Atari online magazine. A-ONE (Atari Online News, Etc.), which will likely debut on Friday, March 5, will be a magazine primarily aimed to serve the Atari community, according to Jacobson. "Our goal," said Jacobson, "is to focus on a magazine which covers material of interest to fellow Atari users. We'll do our best to cover all facets of the Atari experience - computing and console gaming. But, we'll also cover topics that are of a general interest to Atari users: general industry news items and other gaming platforms."

"Joe and I have been using and writing about Atari computers for a long time," says Jacobson. "Between the two of us," he added, "we've probably written for most of the commercial Atari magazines of yesteryear such as Current Notes, Atari Interface, ST Informer, and Atari Explorer. And we just completed a lengthy stint with STReport, an online magazine. We have both considered doing an Atari online magazine on our own for quite some time now. The talks became more serious the past few weeks and many of our STReport readers were asking. The timing was perfect."

Jacobson states that A-ONE readers will see the same coverage as they did with STReport, but more. "Columns such as 'People Are Talking' will continue in A-One," states Jacobson, "and the Atari news items, various announcements and product descriptions will continue. We're also going to continue with the computing and technology industry news section, as well as Atari and other platform gaming news. All of that will remain unchanged, except cosmetically."

When asked what new things A-ONE readers will be able to see in the magazine, Jacobson reported that "we have a lot of new ideas; and we're going to be able to resurrect some old ones! We've talked to Michael Burkley, of Suzy B's fame. A-ONE readers will be happy to learn that Michael has agreed to bring back his "Unabashed Atariophile" column - a column devoted to Atari public domain, shareware, and freeware software. We're also looking to get more involved with Atari internet news. We're working on 'guest columns.' We'll be talking to a number of people to help us make A-ONE the #1 Atari online magazine worldwide."

According to Jacobson, A-ONE will be a text-based magazine. However, he stated that an HTML version hasn't been ruled out as an additional format. "We're in the process of establishing distribution points for the magazine," Jacobson stated. "We'll maintain our e-mail distribution

lists as well as making the magazine available on online services such as Delphi and bulletin boards. We'll also make it available for downloading via numerous Internet web pages. The best way to do this, and make it accessible to all readers, is text. But we realize that some of our readers may want to read A-ONE while on the Internet. The 'plain' text version will be available initially, but we're also considering adding an HTML version, with all the 'eye-candy,' for those who might want it."

To contact A-ONE regarding e-mail subscriptions or other inquiries, send e-mail to dpj@delphi.com . For submissions and related information, send e-mail to jmirando@portone.com .

I don't recall seeing a "130XEGM" anywhere. How does it relate to the
more common 130 XE?

Likewise, what is the "Touch Me"? The fact that you've listed it amongst
the games systems leads me to think it is one, but I dont recall seeing it.

What a dedicated jihad..

So why do you not use the ST for online?

The comparison is very fair. The Milan and Hades are available today.. Are
you stating that the milan is not upto par to the imac? It's not Apple's
fault that the 68k Tos clones have not kept up technology wise...

You mean CompUSA? or Apple?

> Let's start with the pre-sale and the sale of the machine. For historical

> out of the store.

Except for one previous G3 beige Tower, Apple has never shipped a modem with
the retail Pro config machines...This goes back to the pre G3 line such as
the 8600, 9600, 9500, 7500 etc...The vast majority of these machines are

hooked in corp networks were modems are not used.. Not say I agree with Apple's modem approach..

> Next day comes in customer #2 (now Saturday). This person asks pretty much

> I provide that Apple SAYS they are going to release the modem soon.

The Blue G3 modems are available from the Apple store for $100 and soon from Comp for about the same price..The $300 price may not be accurate unless you send back the defective unit were a rebate is applied..

> By Monday, Apple announces the part number. (Would it have been too big a

Check again...there is a retail skuu#

> Customer #2 comes back. I know (as he does) that he wants the machine, and I
> can now tell him that the modems are coming. No apology - still pissed that
> we don't have them in stock.

What can you do...It's a thorny issue and can't go farther than that..By next month all will be forgotten as other vendors enter the G3 market..

> OK... so now the machine is sold. The customer wants memory. I'm not sure
> about any of you, but iMac RAM, IMHO, is goofy. Manufacturers who make it

> had a customer as for a 1/2GB of RAM upgrade and I couldn't give it to him.

Yep....it's common...Comp does not usually stock the higher memory upgrades due to cost...There is always MacWarehouse which typically turns over memory much quicker..

> So anyway, we also don't have any of the bezels for Zip drives and we sure as
> heck don't have any DVD drives or modems yet. So we turn people away - and

> the customer isn't mad at Apple - they're mad at CompUSA.

The only thing you can do is get them on the G3/350 with zip and go from
there. I doubt you will see a aftermarket DVD kit from Apple at retail...

> What can we do about this?

Pray..

It's a little bit faster than the TNT, about 20%, with preliminary
drivers. Should be faster once "real" drivers are in place.

My, what an idiotic remark! MacOS X is so much more than MagiC... And that $995 price includes some serious business/enterprise software. Oh, and let's not forget Net booting too. I don't believe MagiC has TCP/IP built-in, let alone Net booting...

MacOS is a lame excuse for an OS, and you know it. That is the only reason
you post here, because you know full well that neither the Milan or Hades
has the same development budget as Apple has, and so can't compete on the

technological level directly with the big boys.

Meanwhile, you are flaming Atari users for using older but nonetheless very capable technology whilst _you_ are still waiting for Apple to provide you with a decent PMT OS. Don't you think that your attitude is somewhat hypocritical?.

Truth is, any modern PC shits on the iMac in every way, but it's easier to come into an Atari newsgroup and flame rather then face Apple's shortfalls isn't it?.

Wow, a 14" screen powerbook. Why not just take a Lynx with you when your out? Only 64MB of RAM. My antique Falcon has 78MB, 10G's, 56K at 230K DTE and S-Video is only a $1.00 dollar part. MC1377P. You should try installing one yourself sometime. You will wonder why apple charged you so much for it. Why don't you retire that hand-me-down machine you have for something that has the horsepower to pull Mac O/S 8 around at a decent speed?

Mr. Sinclair,
Like a poor marksman , you keep missing the target. I do use my Mega Ste with CAB on the internet. I chose the machine to use based on how I feel that day. I began logging on to the internet when it was still called DARPANET. I have connected with IBM 350's, T/I 99/4a's, Atari 800XL's, Interact model R's and even a Tandy Model 1, Unlike you I do not need the latest colour machine to log online. Nor am I forced to utilize ever increasing funds to do so.

Harold Alley
PS when I attended college in the early 80's (while you were drooling over your formula) I used all of those machines as a Computer Science major.

By the way thank the inventor of USB . His name in Nolan Bushnell, He invented Atari and placed the SIO port on his EIGHT bit computers nearly 20 years before the PC and Mac worlds figured out how to daisy chain peripherals.

Actually Mr. Sinclair I was referring to the PC world. A true professional uses cards based around the Glint, Gloria, Delta, and Razor chip sets. The Mark of a TRUE graphics professional is use of the HEIDI standard coupled with OpenGL. All of these cards are available starting at around $1,100.00. For the PC. the Delta and Glint MX are my favourites. Both offer 1920 x 1080 in 32 bit colour for starter. the Glint MX can go as high as 2750 x 1880 in 16 bit colour. And the card on needs 16 Megs of ram to accomplish this. Try that on an iMac little man!

When going to war know your opponent, or stay at home.

Actually, being an Encarta subscriber, the content is moving to the web.
No big deal really. It certainly has nothing to do with the ever growing
base of those wonderful little machines.

In fact, Microsoft's current lineup of Mac software represent some of
their best work in years. Let's see, oh that's right--they did do an
Atari hack of Write back in 1986....I actually have the brochure as part
of my Atari collection.

C'mon Harold, give up on the Apple bashing. It's over, man. Apple is
still around (and thriving!), what's left of Atari is owned by a
clueless toy manufacturer.

Besides, the whole world knows that Linux on a PowerPC is what rules. :)

I certainly have heard of MiNT, but I have never seen/used it. I don't recall; does it support a GUI, or is it strictly command line? Have you compiled any software for it?

John

Hey. Yes, it does support GUI's. The best alternative desktop to run
with it is Thing. You have GUI support with the Thing desktop as well
as "virtual consoles" that are command line only. <alt><F1 - F9> give
you these desktops. You could theoretically be running 9 differetn apps
from each Vconsole, memory and CPU willing. Quite a bit of software
from the Unix world has been ported/compiled to run under Mint. For
example, a version of ICQ called MICQ runs fine. (check my .SIG for
my ICQ number).

If you would like, I can send you a .JPG or .BMP of my desktop. If I
send it UUencoded, its just slightly under 700K. Let me know if you
want it! ;-)

Catch ya alter...

John
At least Atari NEVER took money from Microsoft just to stay solvent. I myself would rather go bankrupt than to be forced to grovel at the feet of Bill Gates. Of course the Tramiels should burn for what they did to Atari.....

Harold

Actually, Apple invented and holds the patent for firewire. The sound hardware
and motherboard were designed by Apple. So were the keyboard, mouse and case.
But even if your statement that there is no Apple [hardware] techology in
modern Apples were true (which it isn't), what would it matter?

Apple has developed a fair bit of software technology over the last few years.
They have significantly enhanced AppleScript, QuickTime, WebObjects and
YellowBox. They created ColorSync, Quickdraw 3D, Sherlock and Mac OS X Server.

well, TiFKAS, it looks like many Mac users disagree with you - as usual.

Judging by the reaction from users of the iCAB demo on comp.sys.mac.advocacy, they're quite pleased with how well iCAB works - not a pig in memory or in hard drive space, speedy, not bogged down with nonsense, etc.

Of course, you wouldn't know that, since you're too scared to venture into mac.advocacy - could it be that you'd be rendered to french fries in seconds the first time you posted your drivel there...

BTW, next release of the iCAB demo will be in English as well as German.

And as for "sticking to the past" - well, it seems there's work going on an .mp3 player for the Falcon that should be out pretty soon. We may be a bit behind, but it's fun to play catchup to show up just how wrong mouth-breathing disinformationists like you can be in your desperate attempts at brinksmanship over obviously superior debaters...

Nah, this is only a baby one.

There was a couple of OS religion threads back in 1989 - 1991 (mainly Amiga vs PC vs Mac) that went on for more than a year. The Atari camp also briefly chimed in for a couple of months, but they were hammered by everyone because of their inferior platform.

news://news.soundblaster.com/creative.products.sound_blaster.live also has some ridiculous threads that just don't seem to go away, but even those are nothing when compared to the good old Amiga advocacy threads ;-) Although, the SoundBlaster camp are much better at swearing and abusing each other.

Oh, and while we are at it, if you are trying to keep the thread going, you ought to add more groups when cross-posting and also follow up your own posts with faked headers and troll :-)

The Pentium III id is great for software publishers that want a continuous flow of income. One of my ex-employers said they will only support the P-III in their latest release of their high end graphics software. Each customer will have to enable the CPU id so that they can monitor how many CPU's they run and charge a per CPU licence accordingly.

What they eventually want to do is make their customers pay for the CPU-hours they use. The customer will pay each month depending on how many CPUs they used, at what speed and for how long. Until now, they could not do that reliably, but with the P-III they can just force their customers to do it. The clients will still have to purchase their own hardware, but the software is now pay per use.

They reckon that the continuous flow of money from the software has potential to pay for ongoing development. Even if they decide to stop development, many clients will still pay for years to come - easy money.

Neko Inusan

Eh, Beavis..
Apple has been involved with the PowerPC..including the Generation 3 processor
which is optimized for 8...

Apple invented the FireWire technology as well as the tech in OS 8.5 like
Sherlock, Quicktime and the best USB implemintation..Also having developing
Yum casings are original..

You sure...

- Apple has achieved 5 straight profitable quarters (FQ1'98 $47M, FQ2 '98 $55M, FQ3 '98 $101M, FQ4 '98 $106M, FQ1 '99 $152M)

- Apple posted a FY '99 Q1 net profit of $152M, or $.95 EPS, compared to $47M and $.33 EPS in the year ago quarter

- Apple's FY '99 Q1 revenue of $1.7B was up 8% from the year ago quarter

- Apple sold 944,000 units in FY '99 Q1, a huge gain over FY '98 Q1 total of 635,000

- Apple sold over 519,000 iMac computers alone in FY ' 99 Q1, and has sold nearly 1,000,000 iMac systems since 8/14/98

- Apple's overall unit growth was 49% year over year

- Apple unit growth currently outpaces the industry average by 3x to 4x (variability results from different market tracking sources)

- Apple currently has over $2.6B in cash reserves and is generating over $200M more per quarter

- Apple's FY '99 Q1 gross margin of 28.2% was up from 22.4% in the year ago quarter

- Apple exited FY '99 Q1 with only 2 days of inventory ($25M), besting industry-leading Dell's 7 days of inventory

- 45% of U.S. iMac purchasers are new to the Macintosh platform (first time buyers 32%, Windows "converts" 13%)

- 62% of Japanese iMac purchasers are new to the Macintosh platform (first time buyers 46%, Windows "converts" 16%)

- iMac was the number 1 selling computer October - December through retail and mail order channels (source: PC Data)

- The Mac OS is one of only two high-volume operating systems on the face of the planet

- Over 12,000 3rd party products have been developed for the Macintosh

- Over 1,600 new Macintosh software titles have shipped worldwide since the iMac was introduced last May

- Apple's QuickTime multimedia technology is the de facto standard for both Macintosh and Windows

- Over 25,000,000 Macintosh users have installed QuickTime on their systems

- Over 50,000,000 Windows users have installed QuickTime on their systems

- 11,500 CD-ROM titles and hundreds of DVD titles have been authored with QuickTime

- The G3 processor in every Power Macintosh is at least twice as fast as it's Pentium II or III counterpart (Source: BYTEmark tests)

- A Pentium II would have to run at 800MHz to equal the performance of a 400MHz G3 (Source: BYTEmark tests)

- By tightly integrating hardware and system software Apple still delivers the easiest to set-up and use personal computer

- 62% of creative professionals use Macintosh

- 76% of color publishing is done on Macintosh

- 72% of multimedia CD production is done on Macintosh

- 65% of digital video and multimedia production is one on Macintosh

- 64% of Internet Web site content is created on Macintosh
- Overall 47% of HTML and Web publishing is done on Macintosh

- Apple has a 52% installed base share of the U.S. K-12 education market

Me. I'm tired of fat, ugly browsers from Microsoft and Netscape. $30
(the rumored retail price) is pretty trivial.

> Still is buggy and
> I need a dependable browser to get the job done.

It's a preview release. Give them a month or two to get rid of the more
obvious bugs (as opposed to Explorer and Communicator, which are both
still buggy after all these years).

Coming from you, that is almost a submission that the machine is inferior.
Why again, tote around a pile that that? Why not just purchase your own and
write it off on your taxes. Surely with your income you need some tax
advantages?

Exactly what browser do you use that is rock solid? I have used them all,
and I have not found one that could not be crashed even on windows.

iMac is a marketing success, however it's sales are still small compared to
overall PC sales!

> - The G3 processor in every Power Macintosh is at least twice as fast as
> it's Pentium II or III counterpart (Source: BYTEmark tests)
>
> - A Pentium II would have to run at 800MHz to equal the performance of a
> 400MHz G3 (Source: BYTEmark tests)

...Hook...Line...And...Sinker! -0----; :-D

This is marketing "crap" I'm afraid. The BYTEmark test is _not_ a good measure
of processor performance, since it varies greatly on the compiler used and the
optimisations choosen (Apple conveniently fail to mention this!).

The results quoted by Apple are G3 optimised results against 486!!! optimised
results (when running on the Pentium)! When the same test was re-compiled
using Pentium optimisations, it so-called 'toasts' the G3.

Please read the following related link;

http://www.zdnet.com/zdtv/freshgear/viewpoints/story/0,3679,2132167,00.html

The G3 processor is just as good as, but not better than, the equivalent
Pentium II processor. It is slightly faster than the Pentium II for integer
operations, but slighy _slower_ for floating-point operations. In otherwords,
overall performance is about the same. Application benchmarks tend to reflect
this, where performance differences are more to do with software
optimisations and design rather than processor power.

Please read the following benchmark results;

http://www.zdnet.com/pcmag/firstlooks/9808/f980828a.html

> - By tightly integrating hardware and system software Apple still delivers
> the easiest to set-up and use personal computer

Can't argue with that! :-)

> - 62% of creative professionals use Macintosh
> - 76% of color publishing is done on Macintosh
> - 72% of multimedia CD production is done on Macintosh
> - 65% of digital video and multimedia production is one on Macintosh
> - 64% of Internet Web site content is created on Macintosh
> - Overall 47% of HTML and Web publishing is done on Macintosh
> - Apple has a 52% installed base share of the U.S. K-12 education market

Yes, the Macintosh has established a very strong position in a number of
market areas over the years, however, the rest is dominated by the PC, and
the 'wonderful' iMac isn't the machine to change this situation! But who
knows what suprises Steve Jobs has in store for the future! :-)

Should be very interesting!

(Back to my PC for now! :-D)

BTW, where did you get your results from? Are the URLs available?

:)
Dr Yassam

>> comp.sys.mac.advocacy, they're quite pleased with how well iCAB works -
>> not a pig in memory or in hard drive space, speedy, not bogged down
>> with nonsense, etc.
>
>Same feature set?
>Or shades of feature less Calamus?

so far the features on iCAB have proven to be what Mac users want,
not what IE and Netscape have decided what's "good for them". And so
far, at least one Mac journalist has been raving about just how good
and fast iCAB has been to him.

And as for your views on Calamus SL - well, seeing as you've
admitted you've never used the program yourself, that makes your
opinions worthless. (And speaking of comparing Apples to oranges,
you're comparing a web browser to a professional DTP package?)

>
>> And as for "sticking to the past" - well, it seems there's work

Coming from a "man" who has proven time and again he's a pro at
keeping his head buried "up there" so often there are sphincter marks
on his neck. Now that is real pot/kettle/black there,
TiFKAS.

Ah yes, 8.5 - the operating system noted in its initial release for
trashing hard drives. Shurely shome mishtake in Apple's development
department that they should've thorughly squashed before release.

We've already got some nice OSes that give bloated buggy
abominations like 8.5 a nice run for their money - and take up less
system resources.....

>- Over 12,000 3rd party products have been developed for the Macintosh

and it was proven by various third parties, as well as a number of
respected computer journalists, that the BYTEmark was rigged - when
proper benchmarks were put together, some very different results were
discovered (i.e, Celeron 300 stomped an iMac to death). The Steve Jobs

Reality-Distortion Field® has no effect here....

>
>- A Pentium II would have to run at 800MHz to equal the performance of a
>400MHz G3 (Source: BYTEmark tests)

again, based on a rigged BYTEmark. TIFKAS and his favorite Apple
apologist, Don Crabb, have yet to post any results of tests that show
their flawed jingoism. Apple is noted for not putting any hard numbers
in their advertisng leaflets, just meaningless graphs with funny
pictures..

Apple holds 52% of market in education K2-Grade 12

what year? Latest reports has Apple's marketshare rapidly falling
to Compaq, who've pulled in the lead....

In article <7bg6n3$7me$1@nnrp1.dejanews.com>,
TIFKAS commented;

>take your head out of your arse and smell the weeds...
Hey, It takes one, to knows one...

Now, let me see, how shall i put this without hurting your
feelings:
You need to go to a optician as fast as you can, staring at the
crummy
tube from the IMac all day long, probably caused damage to you
eyesight
and brain (Daniel, does a TIFKAS person has a brain ?) or what's
left
of it....

<SNIP>
>- Apple has achieved 5 straight profitable quarters (FQ1'98 $47M,
FQ2
>'98
>$55M, FQ3 '98 $101
Lots of bullshit here...
> $1.7B was up 8% from the year ago quarter
<SNAP>
Where I come from, we call this "creative accounting",

>- Apple's overall unit growth was 49% year over year
From what ? compared with what? peanuts??

>- Apple's FY '99 Q1 gross margin of 28.2% was up from 22.4% in the

>year ago quarter
This proves my point, gross profits by selling overpriced,
overhyped,
flashy boxes to a lot of TIFKAS's.....

>- 45% of U.S. iMac purchasers are new to the Macintosh platform
I'll have a thought for them in my prayers

>- iMac was the number 1 selling computer October - December
through
>retail and mail order
Where, in Timbuktu ??

>- Over 12,000 3rd party products have been developed for the
Macintosh
Daniel, this guy is not a TIFKAS, he's a enormous big TIFKAS, I

suggest
you go to a doctor as quick as you can and have your head examined.

>- Over 1,600 new Macintosh software titles have shipped worldwide
>since the
>iMac was introduced last May
On second thoughts, don't go wasting the doctors time....

>- Over 25,000,000 Macintosh users have installed QuickTime on
their
>systems
In your dreams...., Where are those 25,000,000 users hiding ??

>- The G3 processor in every Power Macintosh is at least twice as
fast
>as it's Pentium II or III counterpart (Source: BYTEmark tests)
Have you heard of the Sun Visual Workstation SGI 320, running on a
Pentium II 450Mhz ? This computer was compared to the latest
Tupperware
box from Apple => G3/400Mhz, sorry mate, but the Tupperware Box was
the
slowest one in all tests. These tests are not benchmarks wich can
be
manipulated but real life tests, the two machines running Photoshop
apps,
rendering a animation, raytracing etc (Source Macup, March99), yes
a
dedicated Apple magazine -)))

>- A Pentium II would have to run at 800MHz to equal the
performance of
>a 400MHz G3 (Source: BYTEmark tests)
I rest my case.... TIFKAS

>- Apple has a 52% installed base share of the U.S. K-12 education
>market
Poor Kids, isn't there a law in the US against Child Abuse ?

>Apple has been involved with the PowerPC..including the Generation
3
>processor
Yes, and it shows, instead of being optimised for speed it's
optimised
to run the buggy Apple OS System.
What's going to happen when the G4 hits the street? the Yosemite
board
inside the Blue Tupperware Box is NOT suited -))) So, they'll have
to
come up with another series of boxes, perhaps we'll be seeing the
launch of a couple of more coloured boxes, and that's the PRO serie
??
New Box, new motherboard, new hype, new things to drool about

TIFKAS...

>Apple invented the FireWire technology as well as the tech in OS
8.5
>like
>Sherlock, Quicktime and the best USB implemintation..Also having
>developing
>Yum casings are original..
Apple DID NOT invent FireWire, what they invented is far less, they
put
down the principles and tech stuff of FireWire but it took IBM,
SONY
and Texas Instruments to name just a few, which developed FireWire
into
what it is now. The first implementation of what is now called
FireWire
could be found in a NEXT computer, the specs looked like nothing
Apple
defined in their IEE338xx standard.
Sherlock, is just a tool to help you find your way around in the
chaos
Apple created.
Quicktime was developed in another lifetime, and having the BEST
USB
implementation, just makes me wet my pants-))).

> System 8.5 is marvelous...
What has changed since System 7.5 ? Nothing, zippo, everytime Apple
has
to adapt their OS so it can run with the newest PC based hardware,
they
give it a new number, and for a "leading" computerfirm which leads
the
way, well, they have NEVER get it right from the start, System 8.5
is
now 8.5.1, adding a few bells and whistles doesn't make a good OS,
usally it makes it more buggy...

So, I rest my case and say it AGAIN:
Apple DID produce wonderfull machines and used to be a inventive
firm,
they introduced Quicktime and prevented Micro$oft to dominate for
100%.
Apple stopped developing Computers in 1995, when they switched to
the
PowerPC, open up a Mac and take a good look => PC Stuff all around,

even the latest pride and joy : the Yosemite motherboard is nothing

more then a adapted ASUS motherboard...
So all that's left is a firm that assembles clones which runs G3s,
but

lets give them a bit credit:
APPLE, Premium flashy computer casing manufacturer including tacky
and
clumsy keyboard& mouse.

I'll see You at the funural

-
Cheers from Belgium

have you tried Bengy Collins' site lately (http://bengy.atari.org)?
He's supposed to have now added info where one can find all commercial
MagiC-related products in North America.

But who knows - judging by the reaction both Ken and I have been
getting regarding questions about where to find Atari stuff (Ken's been
importing Mario Becroft's new hardware mods/adapters from New Zealand,
and he's gotten a LOT of interest, particularly for the new VGA adapter
dongle - in fact, he just sold two of them to US users), I may just go
into part-time business importing the stuff for Canadian and NA users.
Whadaya say?

and speaking of new developments - remember TiFKAS' brain-dead
attack on the Hades, where he said we couldn't utilize DVD?

well, I just downloaded the demo for Uwe Seimet's newest version of
HD Driver - lo and behold, there's DVD support built into the new
driver, as well as SCSI III. I have a funny feeling we'll be seeing DVD
programs for the Milan, Hades and Phenix coming real soon. Maybe even a
nice player program ala CD Player, which would turn even the lowliest
ST into a nice video control player for a DVD drive.

That large sucking sound you hear is TiFKAS trying to extricate his
OTHER foot from his mouth....

One of the pages at the iCab site (www.icab.de) is a test page, with a bit of more complicated html and an explanation (in German) what your browser is supposed to display. Anyone who can read German can open it in Netscape and have a good laugh :-(

yep. In fact, I think most of the vapour seems to be eminating from
the centre of TiFKAS' intelligence :)

Honestly, if there's all these amazing products out there, then why
can't I find them at the Mac dealers? That includes the professional
Mac stores, CP Used, Computer City and of course the mass-volume stores
that sell iMac.

Maybe we should challenge TiFKAS to name all 1600 titles :)

>BTW, Does TAF still do NEWSletters? Since it seems nearly impossible to
>make meetings, and since I haven't seen you post meeting dates, I would simply
>just like to join TAF and receive a newsletter every month.

it's possible - as a matter of fact, we've now dropped the price of
membership in TAF to $25 a year, and I think we still offer a
newsletter-only deal (maybe $20 a year). We've also recently relaxed
our members-only policy to the BBS - we've now opened full use to ALL
Atari/clone/emulator users. (416-421-8999)

BTW, next meeting is March 17th, where I'll be demoing NVDI 5.

I have incredible respect for Jeff Goldblum's acting talent, but he
really should have turned down having to spout off some of the blatant
hooey in the iMac ads. Maybe Apple should rehire him to plead with
consumers to at least considering buying the hideous orange iMac, which
Apple is having trouble unloading.

>

Nope - I have not - I have been very busy rebuilding some financial books into the G3 and cursing at the clumsiness of some of the software after years of happy use of 'That's Write'(anything I need in a WP), 'LDW Power' (creaky and not as printer smart - but stable as hell), 'Pagestream' (flexible, stable and user friendly in a small package), and 'Informer II' (a bit flakey at times but still a nice database) - the connection to the net will have to wait until I get the 'work' done !!!

I'd be very happy to buy stuff from a Canadian Distributor - if it will run under MagicMac (OS 8.5) - the old Atari is just to slow and short of memory - and the new TOS clones are too unavailable to consider.

How about a way to boot out OS 8.5 in favour of Linux ???

The Canadian Curmudgeon (in snowy - 2cm of white stuff - Calgary)

Despite, Chunks asertion that the imac is overpriced...the market has spoken...the imacs have sold out in the U.S. territory up north...maybe Apple should of charged higher price..

Wednesday, March 03, 1999

Want an iMac? Join the waiting
list

Paul Brent
Financial Post

Strawberry, blueberry, grape, tangerine, or lime.

No matter which is your favourite
flavour, chances
are slim that there's an iMac computer
waiting for
you on the shelf at a nearby Apple
dealer.

Supplies of the bright, translucent iMacs are "severely constrained." That's Apple Canada Inc. PR-speak for "sold out until April."

"The demand even exceeded what we thought it would be," said Dennis Manning, an Apple Canada spokesman.

Grape, the most popular colour, has been consistently out of stock since the product's introduction in January. Likewise for blueberry and strawberry.

An enterprising would-be iMac owner might be able to track one down in lime, the least popular colour.

The computers, which sell for about $2,000, are a hot commodity because they do not look like their competitors' boring beige boxes, plus they are configured to run applications such as games faster than IBM-based machines that can cost twice as much.

"What Apple has done is dragged the
computer sector into the mainstream of
marketing," said Mr. Manning, the
spokesman.

Besides home offices, iMacs are turning up in places such as design shops and advertising agencies, where looking cool is as important as being

efficient. Apple likes to tell the story of the woman who brought her drapes into a store to make sure the colour matched.

In Orangeville, Ont., the Orangeville Family Medical Centre contributed to the shortage recently when it bought 28 iMacs for its doctors, nurses, and administrators. The centre's iMacs are all lime, not for design reasons but because it was the only colour available.

"They have a space-age look to them so it is often what people will comment on," said Dr. Cathy Candusso, who handled the purchase of the computers.

The centre staff deny they have become slaves to fashion, even though the iMacs match their green countertops. Dr. Candusso said the adoption of Mac Medical software dictated the use of Macs, and the iMacs were the cheapest option.

If the system is as widely spread as you claim, isn't there a
newsgroup like comp.sys.mac.advocacy or comp.sys.mac.narcisists where
you can all be the happy bunch of beleivers and not bother us in the
Atari forums ... we like opinions not your advertisement or populistic
"facts".
From what I can see you are in some strange way trying to make
us beleive in the Mac phenomenon and it doesn't appear to you we wont.
I have worked as an Apple Authorized Service Engineer and I still
prefer my Atari before my Mac's or PC's (which I work with today).
Atari's are robust machines that are in many ways more usable than
Mac's or PC's, they do lot's by small means. Mac's costs a lot and
does some. Windows boxes costs about nothing and does about the same.

There does not exist the same support and positive attitude we
have in the Atari community in the Mac community, I'm so sorry. But I
understand your viewpoints to a degree, It can't be easy to be the
blind beleiver getting "facts" and not trying out and judging by
yourself.

It's a Mazda.
Honda's have a better build quality and are generally safer (for occupants) in collisions, taking into consideration that in this country most people DO wear seatbelts. I believe that may not be the case in some countries.

Honda motorvehicles are more reliable, although generally very expensive to repair should you have a major mechanical failure, or any accident..

I worked in the trade for 10 years, so my opinion is based on personal experience with a large range of vehicles.

The Jihad 'Chunks' is suffering realitry -distortion mantras because he refuses to believe that iMACS are on a roll up north. Despite...The Jihad 'Chunck' has a personal grudge against one who is more successful in regards to fame and wealth. Here is what a competitor is saying about the imac success. From...the Jihad 'Chunks' what will he come up to counter the Montreal Gazette. Another loony right wing nut running it..

http://www.montrealgazette.com/PAGES/990304/2337269.html

Colour the iMac popular
In Montreal, grape and blueberry prove the top
choices

ALISON MACGREGOR
The Gazette

Apple's advertising campaign for
its new candy-coloured iMac

computers has whetted
consumers' appetites.

Perhaps too much.

The machines - strawberry,
grape, tangerine, lime and
blueberry - are flying out of
stores across Canada. And the
most popular flavours - which
change depending on what part
of the country you happen to be
in - are sold out until April.

"The demand even exceeded what
we thought it would be," said
Dennis Manning, an Apple
Canada spokesman, in an interview, adding that Apple
prefers "constrained" to
"sold out."

Montrealers are not exempt from the frenzy.

"(We're) basically sold out," said Frederick Rosenberg of B.Mac le Magasin, Montreal's only computer store-lounge-cafe. He expects the next shipment in three to four weeks.

Yesterday, the store's iMac stock consisted of six French- language machines. But they were all in the least- popular colours in this city - strawberry and tangerine.

According to Rosenberg, the rest of Canada places
strawberry in the top three.
But "here, it's the tangerine and strawberry that we're
sitting on."

He said sales representatives have reported customers
trying to match the their
iMacs to their home-office decor.

"It happens all the time," said Rosenberg.

Still, he believes that people are more likely to match
computers to their moods
than to their home decor.

"They're just trying to get their favourite-colour kind of thing," said Rosenberg.

His son, for example, chose lime. "He was walking around
and said, 'Daddy.
Green.' "

Montreal's A1-Computers was also sold out of iMacs
yesterday.

But the store sells mostly PCs, said Robert Robin, the
technical manger.

"I think they're trying to make computers as fashionable
as furniture, he said,
commenting on the iMac's "teardrop-shaped system."

As for colour, he hasn't noticed any particular trends.

"We just special-order any colour the customer wants," he said.

We're sold out, but "just the top two colours," said Steve Knowlton, a
sales representative at Central Audio Video in Ville St. Pierre.

He said there is a month-long waiting list for grape and
blueberry iMacs.

But customers can still get lime, tangerine and
strawberry.

"I must say the strawberry is very strange," said
Knowlton. "It looks like it
should be flashing."

Is there some deeper meaning to customers' flavour
preferences?

"It's all about some psychological impression of colour," said Ella Uher,
an art therapist at Concordia University's school of fine arts. She said
people often make subjective choices based on reactions to particular
colours, related to previous life experiences.

Don't cut it? And Calamus does? FYI: The last ST Calamus Jihad(who happens to work at the one of the CompUSA) in the Twin Cities will be trashing Calamus in favor of an all Adobe solution...Why? He is tired of the piss poor Calamus support, being ragged on for owning an Atari ST(not by me-I respect multiplatform chice) and also the Calamus files can't be read at Kinkos.

Macs costs alot? In what way? The $1199 imac according to press accounts
have pretty much sold out. A certain Jihad 'Chunks' has criticised the
supposely high price of the YUMS. Looks like the market does not agree.

3458. Canadian Stores Full of iMacs, TiFKAS full of it!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-05 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36df7a16.0@nemo.idirect.com>
Source record: 3621

yesterday, you may have read one of TiFKAS' (The iDiot Forever Known As Sinclap) pathetic little screeds against his imaginary friend "Chunks" regarding a story from Canada's Other National Newspaper, The National Post (a.k.a. the Daily Tubby) in which they made the incredible claim that the iMac was sold out all over Canada!

Well, I (not his imaginary friend) decided that it might be interesting to see if indeed both TiFKAS and the National Pest writer had gotten his facts straight. And why not straight from the horse's mouth, a.k.a. the dealers.

So I quickly made a few phone calls to a number of known Apple dealers in the Toronto area, both in the 416 and 905 areas. Here's the results of that quick little survey:

- Computer City, Etobicoke: they had a large number of the iMacs in stock - and in all five colours.

- Computer City, Markham: they had a good number of iMacs in stock in red, purple, and the hideous orange colour. The salesman there was quite pleasant as he explained that the red and purple seemed to be the hot colours; he also told me that while he had not read the Daily Tubby article, he had been told about it by a colleague - and said that the claim was "greatly overstated".

- CPUsed, Greater Toronto Area: "sure, we have lots of iMacs in stock", said the salesman on the other line. "They're all green, by the way - how many would you like?" He seemed like he wanted to make a sale desperately.....

- MacWarehouse, GTA - advertising the heck out of the "Rev. B" iMacs they still have in stock in Thursday's Toronto Star, offering a mail-in $150 rebate that would bring the price down to $1450 CDN (gee, if the iMac was really "sold out" across Canada, there shouldn't be ANY Rev Bs left in store, eh?)

- Computer Buyer's Warehouse Direct, Markham: on the same page of the Star, advertising that they had iMacs in stock, ranging from 233-266 MhZ models (which means, of course, that they still have Rev. Bs in stock).

Now, class, what can we conclude from the above?

1) contrary to the National Pest article, there are plenty of iMacs available in stock in the Toronto area - and, most likely, the same can be said for the rest of the Apple dealers across Canada. While the computers are selling, they aren't selling as fast as TiFKAS would want

us to believe.

2) Apple Canada has a bad habit of mistaking "product shipped" with "actual units sold". There IS a difference...

3) Conrad "Tubby" Black was so desperate to get Canada's Other National Newspaper off the ground that he would hire anyone off the street to report - and this particular reporter flunks by simply aping what was purely a press release from Apple Canada as opposed to actually checking the claim by visiting Apple dealers or, at the least, phoning them to see what the stock situation was at them (which I, a simple "Atari Boob", was able to do just which a touch-tone phone and a few minutes of my precious time).

4) years of being exposed to the Steve Jobs Reality-Distortion Field® has left TiFKAS' brain withered and useless. Surely a professional "Apple Power Rep" would take the time to also confirm with the stores that they were out rather than mindlessly post a press release. But then again, maybe he's out to do damage control on the problems he's facing on his side of the border, what with reports that a number of Best Buys have been dismantling their just-recently put up Mac departments and selling off all remaining iMacs dirt cheap...

I'm sure we'll be hearing from TiFKAS on this again - just as soon as he removes his soiled bib with the residue from his much-hated strained spinach which his poor suffering mummy has been trying to get him to eat (and has told him no Cheezy Poofs until he finishes...)

sorry, but you lose - because there is no such thing as an "Atari
Jihad", nor does your imaginary friend "Chunks" exist.

And as for the iMacs being "on a roll", try they've had the bun -
because my own research using just a phone and a few minutes of my time
has shown that there are lots of iMacs for sale in the stores in the
Toronto area...

Despite...The Jihad
>'Chunck' has a personal grudge against one who is more successful in regards
>to fame and wealth.

I (not your imaginary friend "Chunks") have a problem with a man who
buys up competitors' newspapers and folds them so he can have the only
game in town (as Tubby did in Saskatoon), who buys newspapers and
cavalierly fires most of the staff thereby depriving them of their
livelyhood, who uses the newspapers he owns to push his own right-wing
brand of cultural imperialism (like claiming that Augusto Pinochet is a
pillar of democracy), and who uses his paper for a forum for all sorts
of nut-cases (like the judge from Alberta who last week went into a snit
because the Supreme Court overturned his wrong-headed ruling on a sexual
assault case, and used the Posts' letters forums to personally attack a
female Supreme Court Justice - needless to say, he's toast), and who has
personally threatened to horsewhip a female journalist for daring to
expose one of his friends as a low-life crook in one of her books....

Here is what a competitor is saying about the imac
>success. From...the Jihad 'Chunks' what will he come up to counter the
>Montreal Gazette. Another loony right wing nut running it..

plenty. Read the thread "Canadian Stores Full Of iMacs, TiFKAS Full
Of It!", for the results of my OWN research....

>
> even the latest pride and joy : the Yosemite motherboard is nothing

Motorola developed the 68k chips not Apple. Apple had a hand in the PPC design.. And thats bad? What is wrong with ATI Rage 128? Apple used radius and other third party devices in previous products...Or is this just spilled milk?

> more then a adapted ASUS motherboard...

Umm, the Calamus web site has plenty of upgrades to handle professional needs.
Quite a few from just the beginning of this year.
-1

Can't Kinkos read postscript?

-2

What will be the third strike?

My experience with Kinkos. They have outdated machines. I needed to print an
image I scanned on my Falcon. Simple gray scale. File size was about 28 megs.
The print was to be 36"*12". I brought in my own removable with the file and
connected to the powersludge. It took the Mac an ungodly amount of time even
load the image. Printing took over 30 minutes to some high dollar laser
printer. Rotating the image on the Mac was out of the question as I was
paying by the minute. What a joke. The employee let me go without a charge
and said that they will soon update to Pentiums for jobs that require more
power.

Absolutely right. Better late than never. Unlike a certain bloated,
resource hungry Mac OS that still doesn't do pre-emptive multitasking.
How late are you on that, Sin-baby? ;-))))

Bet you are just chewing nails at the thought of a resource friendly OS
like TOS/MiNT running on the PowerPC platform... Hehehehehe.... ;-)))

I don't think I mentioned Calamus at all - never used it - I use Pagestream which is simple, easy to use, and handles my work at a service bureau just fine - too bad there's no Mac version !

The Canadian Curmudgeon (who loves Atari software, but whose ST is getting flakier by the day in Calgary)

3467. Y2K discussion in Chat Room!

CHAT ONLINE *LIVE* WITH ALAN CAMPBELL: YEAR 2000 CONSULTANT

Saturday, March 6th 8:00 pm (Central Standard Time... USA)

We invite Alan Campbell to join us to discuss the Year 2000 and how it will really impact us.

His knowledge of this topic sterms from long term preparation efforts and has been working with top level individuals at U.S. forms about what they can do about it. It will be a very good, informative night.

Find out what is going to happen. Find out what you, the computing user, cannot do without. Find out what the real risks are.

You can ask questions and get answers direct from Alan Saturday Night at 8:00 PM Central Time.

Do you know what your bank will do? Your investments? Your 401K? Your sewage line?

Do you know which dates OTHER than Dec 31, 1999 are endangered? Are you sure?

We won't miss it! Please be there with us online.

HOW DO YOU GET THERE?

Browse to www.AtariUsers.com and enter the main chat room.

You are then able to choose frames or no-frames. This site has been made as CAB friendly as possible. Atari CAB users should use the no-frames link that appears.

This site has also been tested with the common PC browsers and Macintosh Netscape 3.0. While this is a service to the Atari community, others are welcome.

Log in and say hi to whoever is online at the time. Remember that the only scheduled chats are currently Sat. 8:00 pm CST.

This is a big event with a Y2K consulatant is is used to speaking to large gatherings of people. Make it a point to show Alan Campbell a harty Atari welcome!

Ataris in North America were OFTEN sold out. This of course lead to their downfall as they couldn't supply them fast enough when it was very crucial. Selling out isn't always good. Early on STs were diverted to the STrongest market which was Europe. Leaving a less than suitable installed base in North America.

If I couldn't sell a computer for ONE MONTH, I would be right ticked off. A customer (Unless a Mac Jihad) wouldn't wait a month, they would go and buy a PC with MS windows INSTEAD.

Of course a hoard of non moving inventory is not acceptable either, but I can say Atari never had this problem, it was always the opposite.

Of course a few years back wasn't the Mac Classic one of the best sellers? Doesn't say much really does it? Other than there is one born every minute.

I did a little test to check this on my 6100/60. First I created a 10800x3600
8- bit grayscale image (~40MB) and openned it in Graphics Converter. Time to
load was about 10 seconds. Then I rotated it which took about 2 seconds. What
type of computer and software were you using?

AIRC, it was something simular. An older Power Mac. But I do remember the
application. PhotoShop. What a turd. BTW, the file was a TIFF, and not an
8-bit image as I first recalled (it was 24bpp). Stick that in you pipe and
see what results you get. Using Graphics Converter is cheating however:).
It's a nice app, full of features. Wish there was a port:).

I have the oldest and slowest of the Power Macs so the one that you tried it
on can't be any slower.

> But I do remember the
> application. PhotoShop. What a turd.

Photoshop is a big resource hog. You should only use it on a fast computer
with a lot of RAM. Finding the slowest Mac program to do the job isn't a
terribly good way to demonstrate that the Mac itself is slow.

> BTW, the file was a TIFF, and not an
> 8-bit image as I first recalled (it was 24bpp). Stick that in you pipe and

Except for loading, it should be faster since there would be less actual data
to transform due to the overhead in representing the image as a TIFF. I can
actually try it later if you give me the exact size of the image in pixels.
BTW, why would you represent your image at 24bpp? The human eye cannot
differentiate between 16,777,216 shades of gray. The American College of
Radiology and the National Equipment Manufacturers Association have decided

that diagnostic X-rays only need to be 12bpp.

I don't use it. I use Photoline. But it is what Kinkos had to utilize. This
didn't start out as Mac abuse. Mr. Sincrap stated that Kinkos had problems
reading files created on Calamus. It is Kinkos that is lacking in the area of
support here, not Calamus.

Are you a school teacher?.........

The image was scanned for printing, not viewing.
Do you need an explanation why you would want an image scanned at 24bpp for
printer output?

I hope not.

Kinkos does suck but if they are doing the printing then you will have to provide your content in a format that they will accept. If you feel confident, you can always bring postscript files. I've had to readjust my content at Kinkos because the print didn't look right. That would have been problematic if I had been using Calamus.

> Are you a school teacher?.....

Nope, I'm a software developer who works in the medical field. I just gave an example of a type of image that must be very detailed and can be adaquately represented using 4096 shades of gray. That's why I was wondering why you felt that you needed 16,777,216 shades of gray.

Actually, I do. BTW, by "scanned" do you mean "represented"?

> North America.

Big Difference...Apple supplies great numbers worldwide. Half of Apple's
sales are international while Atari had an uneven sales pie like 85% were
international and 15% demoestic. Apple is shipping large quantities to the
market, but according to the press is that their warehouse is empty and
replenishment will be slow in comming.

> If I couldn't sell a computer for ONE MONTH, I would be right ticked off.

The Jihad 'Chunks' needs a net lesson in inventory...According to the press articles, Apple's warehouse is empty and will remain that way until April. Which means what you see as far as iMacs are concerned are it for the month. It's only the seventh day of this month with three weeks to go.

If I was a dealer and had hypothitical monthly iMAC sell through of 125 units a month and had only 50 units on hand for the month, I am screwed. Which means I am negative 75 units lost or hopefully paid backorders with understanding customers. But at least I will have the G3 pro line and PB's

in plenty hypothicaly...

Peter S.

>wing kooks for buying up right wing rags and letting go the staff.

1. Your imaginary friend "Chunks" does not exist, TiFKAS. Neither
are there any "Atari Jihads".

2. The Montreal Gazette can't do that sort of thing, only the
consortium that owns it, Quebecor, which ironically enough DID buy the
Toronto Sun chain and let go some of the staff. But that was a
much-needed housecleaning - and ironically was something the Sun wasn't
expecting, as they had been championing Quebecor as their saviour from
a similar hostile takeover from the Toronto Star group. Just desserts
in this case.

3) as for the article - I respect the Montreal Gazette, but really,
there are more than two Apple stores in Montreal. I'm sure calling them
all and seeing what inventory there are would have shown a very
different picture.

>
>> Well, I (not his imaginary friend) decided that it might be

nope, it's called "doing my homework" and "questioning authority".
Since you, TiFKAS, are a notoriously unreliable source, and an even
worse troll, and since the National Pest is considered having no
journalistic credibility, I thought it best to do what either one of you
failed to do and check up on actual supply at the stores.

TAF is in stable and capable hands under Ken Macdonald as well as
the rest of the TAF executive. I'm currently looking at several offers
from a number of interesting companies for furthering myself.

BTW, the syntax of the above paragraph is lousy, and you mispelled
TAF. I'm sure you were knocking back a few when you replied to my
missive.

Quit crying over spilled milk - it won't get you anywhere.....

there's only 416 and 905. Surely anyone with the full 24 ounces of
cranial matter would check the front of the phone book and confirm
that. Oh I forgot, you only now have 4 ozs after your brain was fried
by the Steve Jobs Reality-Distortion Field - which makes you a true
Quarter-Pounder person :)

>
>> - Computer City, Etobicoke: they had a large number of the iMacs in
>> stock - and in all five colours.
>
>And what was that number?

number is irrelevant - what was confirmed in my conversation with
the clerk was that 1) they have all five colours in stock, and b) they
had stock. The claim was made that iMacs were hard to find in Canada -
and I am disproving it.

Again, quit crying over spilled milk, TiFKAS - I'm sure that Mummy will
pick up your bottle and hand it back to you.....

>The Jihad 'Chunks' needs a net lesson in inventory...According to the press
>articles, Apple's warehouse is empty and will remain that way until April.
>Which means what you see as far as iMacs are concerned are it for the month.
>It's only the seventh day of this month with three weeks to go.

and again, the claim was made that iMacs were "hard to find" and
"sold out all over Canada" at the time of writing - which my phone calls
have proven that is not the case - indeed, there are STILL dealers that
have the original Rev Bs in stock, and are desperately trying to get rid
of them. Care to spin and damage-control THAT aspect of my findings?.
You need a lesson in journalistic ethics - of course, the "ethics" part
has been a stumbling block for you.

want more milk, baby?
>

ah, yes, the Powerbook. Certainly a great success - which is why
Apple recently dropped the price to 1999 USD, obstenably to clear all
the units gathering dust. Why they're so desperate they're giving them
to even their most clueless "Power Reps" who are too cheap to buy their
own, more powerful personal systems....

No Cheezy Poofs for you until you finish your strained spinach,
Junior....

Problem is, when presented with the facts, TiFKAS claims that all the tests are biased and that PC Magazines who do the tests fudge their results in order to protect their "vested interests" (as opposed to their interests that wear 3-piece suits ?) beacause they're afraid of the iMac (when in truth the tests were done because they felt Jobs was trying to use another Reality-Distortion Field in puffing up the iMac and decided they knew a challenge when they saw one). Very funny, when you consider that while the iMac did sell 800,000 units, over the same period the PC manufacturers sold 40,000,000 PCs combined.

And it also appears that TiFKAS is still perpetuating the myth that the iMacs are "all sold out", when in reality it's the fact that Apple has no iMacs in their warehouse because they shipped them to their dealers. My own research has shown otherwise - plenty of iMacs in the stores in Toronto (including Rev Bs that the shop owners are desperately trying to sell off with rebates), and I would suspect the issue to be just about the same all about the country. This is where the market is speaking loud and clear, but TiFKAS is still shoving parsley in his ears to try to keep out the truth.

And if the iMac is REALLY doing so well in the States, then why are a number of Best Buys (which had only recently come on board again regarding Apple) now dismantling their displays and selling off their remaining stock dirt cheap? I notice that when I mentioned them in this report that TiFKAS never bothered to refute this - perhaps the little weinerhead knows what's really going on?

>>and compare to Atari web sites run of of Peecees....

so TiFKAS now claims that there are more Mac sites than Atari
sites? I'd say they'd be roughly equal - in fact, check out my page of
links at http://webhome.idirect.com/~dreibel/yecprohardware/links.htm
and you'll find a whole slew of sites dedicated to Atari.

And, oh yes, the Apple website, (http://www.apple.com) which last
time I looked wasn't even hosted on a Mac, but some sort of PC. Guess
that won't happen until they get the bugs out of the now-delayed MacOSX
Server - I wouldn't blame Steve Jobs about this, especially after his
complete humiliation at MacWorld Tokyo that led to another one of his
infamous hissy fits. Can't wait for TiFKAS' damage-control on this
(guess he'll pull out another categorical denial from Mr. Crawford that
the incident never happened)......

Why always catching up...why not be the first for once? Deja is here and the
future as a portal. I find the newsreaders obsolete and very limiting. Also
the Usenet feeds through earthlink is rather limiting. I prefer the portal
route with my personal channel..

> Overall ease of use and simplicity has been an inherent part of Atari design

Yea....

In the past two issues of Next Generation has a interesting series of back
page articles of the Tramiel's running of Atari.

Why has not intel disputed the Byte tests? The tests done by the PC rags have
been disputed and were fudged..

The truth hurts does it?

Apple is sold out at the warehouse according to the Montreal gazzette
indicating higher sales than anticipated.

What are they going to tell you on the phone. I have no doubt that they
currently have plenty ...but remember no replenishment until April.. Call
next week and get a physical count of the inventory.

According to Computer Retail Week, Best Buy will recieve first Yums in May
when a new iMac planogram is formalized. The current planogram could not
support 5 Yum's. Thats why there has been dismantling once the Rev B's are

sold.

Yea, but are they active with daily updates or old and stale for months. Much
of the Mac web sites are active with are updated by the minute...

Ducking the issue here. At least we have a below $2000 PB to make up for low iMacs...

When will there be a TOS laptop? Year 2003?

Why would I need a second PB for? When I got the PB 3400 at the time, I stopped using my Performa 6200 and sold it to a School Teacher.

I did not say it's equal ... I said it's better, just judge what you
can do with the equal amount of money spent. More with the PC. Perhaps
you personally can't do much because of limited perspective but that's
a totally different matter.
Tell me, why is it that Apple adapts PC hardware to their
system and not vice versa?

Do you need everything troughly explained before you get it? Ok, see
architectures that are equal ... then see performance. Then the Mac
has a hard time. Just like the iMac has.
Like the MacOS ... MacOS was not first OS with drag and drop
GUI, not first with the icons and the trashcan. Digital did it first
in their OS called GEM ... which is what we use on Atari by the way.

now I certainly don't recall that spam you've posted as having any
hard numbers either, so why should I produce any? All it basically
claimed was that "iMacs were sold out or hard to come by all over
Canada" at this moment. I just simply made a few phone calls and showed
that it was NOT the case (in fact, one employee at a Computer City told
me the article was "greatly overstated").

>>
>> and again, the claim was made that iMacs were "hard to find" and

yes, a big difference - empty warehouses do not equate "sold out all
over the country" when stock is still sitting on the shelves and stores
have to apply rebates to sell them....

>>
>> ah, yes, the Powerbook. Certainly a great success - which is why

>iMacs...

not ducking the issue. Simply pointing out that the PowerBook,
despite your constant drooling, appears to have failed to have
revolutionized or caught on with the public to have Apple blowing them
out at the Apple version of fire-sale prices...
>
>When will there be a TOS laptop? Year 2003?

there already is a TOS laptop - it's called running GEMulator, TOSBox or
MagiCPC on a PC laptop, or MagiCMac on a Powerbook. Works quite well,
as a matter of fact.

Of course, I wouldn't put it past the Milan team to surprise us
with a home-grown laptop in the near future :)
>
>Why would I need a second PB for? When I got the PB 3400 at the time, I

you constantly brag loud and long about how insanely great the
current Macs are, and then don't follow through on spending the money to
back it up. Surely someone of your income bracket should be able to
afford the new G3 Tower, rather than to accept handouts from your
employer of yesterday's technology?

>

TOS notebooks/laptops exist right now!
they are MAC or IBM hardware, but their operating system is TOS.
superior pre-emptive(or co-operative) multitasking at twice the speed.

My 040 Falcon easily outperforms my Quadra, and if your talking about the
60Mhz PPC's, they are hampered by the OS. Sure, the processor is faster, but
you rarely get the chance to feel the power. On the Falcon, at least the 040
performs well, and is not burden by an OS that took the hardware ten years to
cache up to..... Dick Head.

3494. 24 bit for Quin

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-11 00:00:00 UTC
From: magicmac@my-dejanews.com
Message-ID: <7c7m3v$8hl$1@nnrp1.dejanews.com>
Source record: 3557

I admit that I haven't used as many scanners that PC shopper test in a year, but most of the models, and software too, default to either 8 bit or 24 bit color (probably with the newer scanners, it's more like 30 or 36 bit color, regardless of what the human eye can see). I doubt that there is a 12 bit setting, at least for consumer products.

There reason for this, I believe you quirred, is to provide the software as much color information as possible in order to reproduce the scanned image as closely as possible on a printer.

I'm sure that 12 bit, which was probably digitally converted at some point from either 24, 30, 36 bit, is fine for transparent XRAY film. 12 bit information for the 1440 DPI Epson printers, and the Epson Photo, would reduce the reproduction quality.

You were talking about a grayscale image. A grayscale image only needs a
single channel. The scanners that you are refering to are color scanners and
use three channels. That means that a 36-bit scanner can have three 12-bit
channels. When scanning a grayscale image, the color channels will be
identical so you are wasting a lot of space to store the same information as
could be stored in a 12- bit single channel image.

> There reason for this, I believe you quirred, is to provide the software as

Grayscale doesn't have any color information, only intensity information and
4096 is a lot of intensities.

When printing a grayscale image on a CMYK printer, you are sending zero values
for every component except for the K (black) component. So really you are
wasting space storing the image using 24, 30 or 36 bits per pixel when you
really only have 8, 10 or 12 bits per pixel of interesting information.

Mr. Sinclair,
Once more you shoot your mouth off before checking you facts. Although the one single Byte processor test does show that the G3 is indeed faster that the fastest Intel. You fail to mention ANY of the other BYTEMARK tests.
WHY?
I would direct you to read a review on popular PC's (low-priced and expensive) and Macs running G3's. Specifically the Popular Mechanics article. I choose Popular Mechanics because THEY are not a biased PC suffragette. In the article the G3 bested every PC processor from AMD, Cyrix/IBM, and Intel. However the G3 based Apples produced the worst real world performance of any of the machines including the cheapest machine tested. Which happened to be a AMD K6-2 300 based PC for $699.00 complete. (32 megs, 32x CD, 4 Megs video, FLOPPY, 6 Gigs HD, 56K modem, 2 USB, 17" inch monitor. Montego sound......)
Could it be that the G3 is stunted by inferior board throughput.
So inferior that the Baltimore City, Baltimore County, Harford County, Howard County, Anne Arundel County, Carroll County, Montgomery County, and Prince George's County boards of education's' have all dumped the Mac as the official computers of choice.
Background on this area: 2.5 million population
Statistically the most affluent area per
capita on the east coast
>480, 000 students
Per capita average income of the 7 Counties
>108,000
Obviously not your back woods locals, But a sophisticated affluent professional

population.

I am not saying that Apple is dead in these schools. far from it. But I thought you might like to know that current and future purchases of machines currently is 20 to 25 to 1 in favour of Win Tel machines.

Why always catching up...why not be the first for once? Deja is
here and the future as a portal. I find the news readers obsolete and very limiting. Also the Usenet feeds through earthlink is rather limiting. I prefer the portal route with my personal channel..

You might be interested in hearing that all of the major portals are now having huge problems. In a nutshell 1. Information gathered by these portals about their subscribers is being treated now legally in the same manner as personal information held by ISP's Big Brother is going to take your anonymity (once a prime reason for using a portal) away. As I mentioned once before WE ARE ALL AT RISK by what we say at least in the USA and Canada.
Admittedly these laws are silly but I will repeat myself. Big Brother wants to squash our rights. For more info visit:
http://www.news.com/News/Item/0%2C4%2C33560%2C00.html?dd.ne.htmldisp.hl.ne
By the way this page should be CAB 1.5 friendly
Why is Earthlink limiting?
Because you can no longer access it and violate Earthlinks T.O.S. in the process?
For those readers not in the know Earthlink now prevents outsiders from accessing its News group server after several outsiders utilized the server to spam and harass certain newsgroups.

Lastly after a careful survey of Baltimore's CompUSA and Best Buys you will find plenty of iMacs sitting in stores. Notice I said sitting not simply in inventory. On average from all stores for every 50 to 150 PC's out the door an iMac gets sold. Not very good numbers from Bill Gates second company.

3497. TAF Meeting March 17th - NVDI 5 Demonstration

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-11 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36e7d288.0@nemo.idirect.com>
Source record: 3560
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari

Agenda for the Wednsday, March 17th, 1999, meeting of the Toronto Atari Federation:

Are you considering migrating to another computer platform because you can't find drivers for the new inkjet and laser printers on the market? Have you had it with GDOS and its bitmapped fonts, and want to use the many Postscript Type 1, TrueType and Speedo vector fonts out there for your projects? Or are you craving for some system speed in the video output of your classic ST?

Then this upcoming TAF meeting may well be right up your alley - for we'll be doing a hands-on demonstration of the Behne Brothers' newest version of their screen accelerator/font handler! Now at version 5, NVDI optimizes the ST/TT/Falcon/TOS clones' video output for faster screen redrawing and updates, as well as acting as a superior font handling package that opens up the many public domain and commercial fonts enjoyed by Mac and PC users for use in many of the ST's word processor and art packages. PLUS! This new version of NVDI offers literally dozens of new printer drivers, including ones for the latest offerings from Hewlett-Packard, Canon and Epson. AND! If you're a user of a third-party graphics card, or use the MagiCMac and MagiCPC emulators. you'll be pleased to know that NVDI now no longer requires a special version to be installed...

We'll also be testing output from some of the many Atari programs that can make use of NVDI 5, utilizing a donated HP DeskJet 540, so you can see the results for yourself.

If printed output is your specialty, if you've been drooling over printers like the Epson 740, or if you want to put some spark in the ol' dog, the demo of NVDI was tailored especially for you! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month in the North York Memorial Community Hall on the lower (or concourse) level of the North York Civic Library at 5110 Yonge Street at Parkholme Avenue. Public transport users can take the TTC's Yonge-University-Spadina line to North York Centre Station.

Meetings start at 7:00 PM; admission for non-members is $2. A one-year membership is $25 CDN a year, which includes a subscription to the club newsletter PHOENIX and full use of the TAF BBS. TAF membership IS Atari support!

TAF Info: - 416-533-0504 or 416-766-4743
TAF Online! BBS - 416-421-8999 [8-N-1] now open to ALL Atarians

TAF Internet WEb Page - http://welcome.to/taf or http://taf.atari.org
TAF e-mail contact - dreibel@idirect.com or anarkist@idirect.com

"Nevertheless, THE FUJI STILL LIVES!"

You misunderstood my correction when I said the image was a TIFF. It was
scanned at 24 bit color. The photo was however black and white, but that is
continous tone, which was represented by color (24bit). What you say below is
true for a 256 shade gray scale image, but not in the case I was using. You
machine, especially a 60Mhz PPC would puke on this image working under
Photoshop.

Nuff said.

I did not know that the TOS bucket line had equal software...I thought it was
all public domain or shareware.

Try speed test when both machines are running either AppleWorks or MS Office
or Photoshop and get back to me.

I did not make the claim that iMacs were not selling off the shelf. You did.
All you made was phone calls and not a physical count. The salesperson were
of course going to say that there are plenty of Yums in the store to get you
in the store.

Until you can verify sell through and inventory on hand, you will have lost
this as well.

Hypo...A store typically sells 125 YUMS a month but has only allocated 50
units for the month. By March 11, 15 units remain(the unpopular color(s)
remain). What do you call this plenty? I call it a disaster..

There not being blown out at fire sale prices.. Apple only reduced the 233
model to $1999 from $2299. I don't call that a blow out price. the pricing
on the others have not changed.

COMPAQ AND THE REST have reduced notebook pricing in the last month. Apple
is no different.

Oh, and why not just load the fucking Mac OS while I am at it.
It's funny you support a failing platform, and quote software that is a major
cause of its demise.

Lets see. I can run Photoline on my PII 450 (under NT or TOS on the same
machine). Whenever the Mac is supported well enough for the authors to port a
version over to the Mac, then we can run the compairson. Or, you could run one
of the fantastic Windows emulators on your Powersludge and load Photoline.
Either way you hack it, you have a machine that does not perform in a cross
platform enviroment as well as the PC (or TOS machine for that matter).

MS Office? I that wher Monica worked? Is Appleworks a spin off of Atari Works?

Like I said.....Dick Head

>All you made was phone calls and not a physical count. The salesperson were
>of course going to say that there are plenty of Yums in the store to get you
>in the store.

nope - the claim was made in the article in both the National Pest (which you have now curiously dropped as proof) and in the Montreal Gazette (which you posted and were crowing about - and now appear to be eating crow over) were that iMacs were "in short supply" and in some cases "sold out and hard to get" - and with no hard numbers to back it up, only Apple's claims of an empty warehouse. Since you claim to be an "Apple Power Rep", you of all people should find it easiest to come up with hard numbers. The burden of proof is on YOU, not me.

And, BTW, if in your fantasy scenario the salesman told me that there were "plenty of YUMS in the store" to get me to come in when they had little or no stock, that salesman (and the store) would be in big trouble - it's called "bait and switch", and it happens to be a criminal offence here in Ontario, with huge fines handed out to the perpetrators. I think any salesman worth his salt at Computer City would think twice about telling that lie.

>
>Until you can verify sell through and inventory on hand, you will have lost
>this as well.

Nope, the burden of proof is on YOU, not ME, to prove inventory and sell-through - YOU are the one who claims to be the "professional". Or are you going to try the lame excuse of a "non-disclosure agreement" to weasel out of this one?

You remind me of an incident with Norman Mailer - how he picked a fight with a prize fighter, who then proceeded to pound the snot out of Mailer. Even though Mailer was reduced to chutney by the prize fighter, he hobbled away insisting he had won. You, TiFKAS, are acting like

Mailer, since you have been constantly debunked, outsmarted,
outshouted, and outed as a complete ignoramous who has been caught many
times to be fudging your data in order to maintain the Steve Jobs
Reality-Distortion Field.

>Hypo...A store typically sells 125 YUMS a month but has only allocated 50
>units for the month. By March 11, 15 units remain(the unpopular color(s)
>remain). What do you call this plenty? I call it a disaster..

no, a disaster is trying to convince the public that there are "no
iMacs available for sale in the stores" HERE and NOW, only to show that
there are indeed plenty HERE and NOW.

My, it's March 11th - who has stock? Oh, lookee here in the March
11th Toronto Star - Computer Buyers Warehouse still has plenty of iMacs
(including Rev. Bs) in stock. Both Computer Citys have stock on hand.
CPUsed has lime, tangerine and strawberry iMacs in stock (strange, as
they told me they only had lime last week - where DID they come from?)
as well as offering Rev B. iMacs at $1599 & tax. Oh yes, and in NOW
magazine, Computer Systems Centre on Spadina & College is advertising
they have ALL FIVE COLOURS in stock! Gee, what's that funny smell - I
believe the SJR-DF is overloading it's circuits, guess it was never
designed to handle so much truth and logic thrown at it :)

When you find yourself in a hole TiFKAS, the first thing you do is
to quit digging. :)

>>
>> yes, a big difference - empty warehouses do not equate "sold out all
>> over the country" when stock is still sitting on the shelves and stores
>> have to apply rebates to sell them....
>>

Macs original SCSI was a terrible creation. It was only after they adopted
the standard that it actually worked. What is the use of FireWire now with
USB? A PC owner could have ordered an ATI Rage before the iStapler was
available, but with better cards on the market, why would they bother?

FOR MR. SINCLAIR IF YOU DARE (oh I rhymed!)

ATTENTION ATTENTION ATTENTION

Hot off the press. IBM and Motorola dissolve their PPC pact and development center. IBM will shortly phase out the G3 (32 bit) and will replace it with the G4 (64 bit) which is aimed solely at the server market. IBM states that one of the prime reasons for leave the market is the fact that Apple killed off the clone market. It is IBM feeling that had such a market existed today the story would be different. Sorry iMac Motorola will begin looking for other uses for its G3 as it now no longer has the services of the IBM development team. Motorola is aiming the PPC at the communications channel now. So Apple may some find itself starved out of the market due to a lack of new design chips.
Link to here for the story:
http://www.news.com/News/Item/0%2C4%2C33696%2C00.html?dd.ne.htmldisp.hl.ne

Interestingly enough to quote Martin Reynolds a chip analyst with Gartner Group Dataquest
"On the other hand, Apple in no longer a performance story and the issue may well be irrelevant

This was done a while ago.

> IBM will shortly phase out the G3 (32 bit) and will replace it with the G4
> (64 bit) which is aimed solely at the server market.

Where does it say this? It says: "...emphasis at IBM these days is on 64-bit
chips that are used in its in-house computer lines--not the Macintosh." I
didn't read anything about them phasing out the G3 or about the 64-bit chips
only being aimed at the server market.

> IBM states that one of the prime reasons for leave the market is the fact
> that Apple killed off the clone market. It is IBM feeling that had such a

No IBM didn't state this. Analysts did.

> Sorry iMac Motorola will begin looking for other uses for its G3 as it now no
> longer has the services of the IBM development team. Motorola is aiming

> starved out of the market due to a lack of new design chips.

Interesting analysis. Motorola has been selling PowerPC chips to the embedded
market for years. Targetting communication systems is a very logical step
since these systems are really taking off and PowerPC chips offer high-speed,
low- cost and power efficient solutions. Remember that MIPS is able to
produce fast, cheap and power efficient chips (MIPS chips are prevelant in
Windows CE handhelds) with a fraction of the market of PowerPC chips.

The House has a bill set up for a vote ASAP on whether to charge LD charges for Internet access even if you dial-up locally. This is something that affects each of us. Please read and forward:

Congress will be voting in less than two weeks. CNN stated that the Government would, in two weeks time, decide to allow or not allow a charge to your phone bill equal to a Long Distance call EACH time you access the Internet.

The address is http://www.house.gov/writerep/

If you choose, visit the address above and fill out the necessary form! If EACH one of us, forwards this message on to others in a hurry, we may be able to prevent this injustice from happening!

PLEASE PASS THIS ON!!!

The Rage chipset was first on for the PC but the Rage 128 chipset was first
available for the Mac. Also, Firewire ports were available in Sony computer
systems before Apple included them on the new G3s. Adaptec also had
(expensive) PCI firewire cards before the G3s were available.

> I am impressed! You actually got a point there. Atari was late with

So was Apple. Sun, NeXT and Apollo all used 68K processors and were usually a
generation ahead of Apple. NeXT was even considering using PPC processors
before they got out of the hardware buisness.

> There you proove your level of knowledge. I suggest you do some basic

GEM was not, of course, a knock-off. I do agree with the horrible part.

His analysis is a bad one..Motorola and IBM are still in the PPC game and will
prosper with increased iMacs and G3 sales..

A sign of relief...If he stated the opposite, Apple would be in trouble.

The original SCSI began life on the Mac Plus and it worked well. FireWire is
for high performance while USB is for low cost connection which works well.
Check out the firewire hard drives and digital devices..

Yea can they order the Rage 128 card? First on MAC...

What demise? These software apps drive the platform. With the release of the
new $499 Mac OS server...will expand the base..

Unlike hack and slash apps that have caused erosion of the TOS base..

> Lets see. I can run Photoline on my PII 450 (under NT or TOS on the same

I used the Montreal paper to back up the National Post to counter your
reality distortion denial. Why not drop in to these outlets to see whats
left.. I can't comment on the numbers due to company confidentialy and NDA...

> And, BTW, if in your fantasy scenario the salesman told me that

NDA keeps me from disclosing plusvalid reasons.. All firms have this...You
can not disclose company information due to legal and cpmpetitive reasons.
Does your hardware store disclose company info to their competitiors?

The erosion of the TOS base was caused by hardware, not software. The software
is the only reason that it survives in the numbers it does today.

That is the point. It can be run on TOS hardware and Intel machines. It's just
not worth the time to port it over to the Mac considering the small user base.

Lets see, first you admit that your a Dick Head in the last reply, and now you
admit that it took Apple hardware ten years to cache up to their bloated O/S.
Boy, I should quit while I am ahead (not a Dick aHead:).
As far as the O/S not doing as much, I perfer to leave that up to client
applications. Having a choice more than color means more to some people than
others......

Sorry, that magazine is not available in this area. Neither are the new iStaplers. What is wrong with Apple marketing? Why can't I drive to my local Apple dealer and see this new product? Why can't I purchase an inexpensive clone of this item? Why is Apple going back to it obsolete Mac Plus/SE look for its new computer line? I want one with a 17" monitor. 15" is just to small. What should I do? My friends iStapler (in a town far far away) isn't as fast as the new Pentiums. How can I upgrade to a new PPC processor. He has 4gig of ram. How can I install that in an iStapler? If I open up a new iStapler to install a CD Recorder (it looks like the iStapler will take up all my deskspace, where now my digital LCD display sits) will it void its warrenty? I don't like any of the colors that are offered. When will it be available in transparent black or silver? I think the clear accessories suck. The scratches really show up now. Will Apple market a plastic repair kit to cover them up? Why dont you take a train the next trip you make, SinCrap?

Mike

3527. Canadian Stores STILL full of iMacs! TiFKAS STILL eating strained spinach!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-19 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36f259e3.0@nemo.idirect.com>
Source record: 3590

an update to my continued refuting of The iDiot Forever Known As Sinclap's (TiFKAS) wild claims that the overpriced, overhyped, underpowered iMac is "sold out all over Canada"....

CPUsed (Bathurst & Dupont) - went in. Several in boxes, all lime green, on the floor. One set up for display - someone had messed up the arrangement of the desktop (I was kind enough to fix everything up for them). BTW, overheard a conversation by a salesman about why the G3 Powerbook had a fire-sale price drop - "because Apple has a warehouse full of these and they're having trouble getting rid of them, and they can't release any more new models until they're all sold".

Computer Systems Centre (Spadina & College) - about 10 iMacs on the floor in boxes, all five colours. Five iMacs on display on a round table - strangely, all facing butt-out rather than screen out.

FutureShop ad (Toronto Sun) - they're having a "clearance sale" of a number of slow-moving computers. Oh, look at this - they're selling off their iMacs. Their 233 mHZ "Rev B" iMacs! (My, if iMacs are supposed to be "so hard to get" in Canada, WHY ARE THERE STILL REV B.s AVAILABLE!)

Long & McQuades (Ossington & Bloor) - four iMacs on the floor, all in boxes. Two Rev. Bs, two YUMs (again, if the iMac is supposedly "sold out all over Canada", why are there STILL REV. Bs AVAILABLE!) Also did not see any iMac compatible MIDI-to-USB adapters which TiFKAS was swearing he saw at Apple's headquarters (in between boot-licking sessions with Steve Jobs?) But also noted - L&McQ were selling off a number of their Mac sequencer packages at fire-sale prices....

Gee, all I had to do was to walk into three businesses and I happened to find a good number of iMacs in stock (which strangely, TiFKAS swore that would be out of them by the middle of March). I stayed there in each place for around 15 minutes each, and didn't see crazed crowds searching for iMacs being sold every 15 seconds :). Now surely, the reporter for the National Pest (one of the sources of TiFKAS' wild claims) should have VERIFIED beforehand what was essentially an Apple press release by simply walking into an authorized Apple dealer and done a count (or even made a phone call).....

That explosion you just heard was the Steve Jobs Reality-Distortion Field® finally imploding into 17,670,002 micro-cells - the strain of trying to use it in the logic-laden enviroment of atari.advocacy was obviously too much. I'm sure that TiFKAS will have it up and running again for another batch of his steaming piles of drivel - as soon as he chokes down another bowl of his strained spinach. Will TiFKAS admit he made a boo-boo - or will he direct another of his brain-dead paranoid

rants against imaginary "Atari Jihads" lead by his equally imaginary
friend "Chunks", instead?

BTW, TiFKAS, I DO have a life. I just happened to be in those areas
that day (my day off) and felt it was my civic duty to check up on
stock apparently on hand - to show you up for the cheesehead you
obviously are...

Daniel, I suppose you did at least notice the 12000 3th party products
and the 1600 new developed Mac software titles which are shipping
worldwide and selling like hotcakes according to TIFKAS ???

> searching for iMacs being sold every 15 seconds :
Lets be fair, TIFKAS said that every 15 seconds a iMac was produced, he
never said that these got sold at that rate... A normal person would
expect this, but in the case of TIFKAS.......

The big empty bubble will explode soon, I'll see you at the funeral
service TIFKAS..

Cheers from Belgium (iMac bursting out of the shops)

Dennis

nope. None of the dealers had anywhere near what TiFKAS has been
claiming. Not even the imaginary "12 30-foot piles" which he claimed
about a year ago. At the most I would count around thirty-40 titles on
hand at Computer Systems Centre, which seemed to be the best stocked
one. I'm going out to the Etobicoke Computer City this weekend so I'll
get a firsthand look there as well (gotta be fair :))

Of course, could Steve "�berboss" Jobs be lumping PD and shareware
in with the commercial titles to come up with that rather high count? :)

Eh..iMike..

If you want larger monitor and expandibility get a blue/white G3. There will
be a USB CD recorder. As for other colors, thats upto Steve Jobs.

Because unlike Europe, trains are not available for a short distance between
MN and WI..Plus I get mileage...

ahhh, dodging the issue - according to your article there should be LITTLE TO NO iMACS left at all in Canada! That includes Rev Bs. Plus, I believe you were the one cackling about FutureShop carrying the iMac and gloating that "they must be selling well".

More strained spinach?

>
>> Long & McQuades (Ossington & Bloor) - four iMacs on the floor, all

according to the articles you posted, there should be "little-to-no
iMacs available for sale" - which should also include Rev Bs. You also
brayed that by the middle of the month that all dealers should be out
of iMacs. My research proves you wrong as usual, weinerhead....

too afraid to admit you made a boo-boo?

> Tell the stores to order the USB midi stuff. Just needs initiative and a
>market...

or maybe it's the fact that there's really no driver support for
the iMac yet - that's according to a MIDI professional I talked to at
TAF last week. STILL no support for the new Roland USB-to-MIDI adaptor,
which seems to be the major player. Or maybe they're waiting for a
version of Cubase (the major player for the Mac sequencer) that will
work with floppyless G3s (Cubase uses a key disc for the Mac - Jobs has
shot himself in the foot)

according to the articles you quoted, the iMacs should have been
out of stock or hard to find at the time they were written. You also
claimed that by the middle of the month they should've been all gone.
Both scenarios have been proven wrong.

Still in denial that the iMac is not doing as well as you're claiming?

1) your imaginary friend "Chunks" does not exist

2) the articles claimed that it was hard to find an iMac. As again
I point out, I was able to walk into several Apple dealers and finding
a good number of them in stock, even at this late date - including Rev
Bs, which should have been all sold out by now.

When are you going to quit crying over the spilled milk?

Anti-Mac Jihad Aaron Golbergs mea culpa on iMac sales...
Of course...a certain Atari-Fuji Jihad individual who we call on the "chunky' side will not believe it and will rant that it's part of a Steve Jobs reality distortion conspiracy..

Before
http://www.zdii.com/industry_list.asp?mode=news&doc_id=ZD2160213&pic=Y

After
http://www.zdinfobeads.com/INSIDER/PAGES/TOPICS/Consumer_Market/031199/

March 11, 1999

The iMac Bunny: It Just Keeps Going and Going and Going.....

OK, when I started to really look closely at what the fourth quarter iMac sales looked like, I expected some drop off. Mostly because the initial rush of Mac bigots had subsided, and the end of the Q4 selling season spelled the peak of Apple's success in the retail market. After all, it seemed that the limited market of those individuals wanting to go "non-standard" would be exhausted and that our PC attention (which spans about two months) would turn to other hot products.

Well, that is certainly NOT what happened.

The latest data from InfoBeads shows that Apple has not only kept the momentum up, but they also actually gained share in the retail market in January. This gain shows that there is more long-term strength in the Mac market than I initially thought. The iMac has really held up surprisingly well and now, months after the initial spike, is still the third best-selling product in retail.

Source: StoreBoard

However, taking the best "what have you done for me lately" view of Apple - now that they've passed from Q4 into Q1 in good shape - I ask myself, "what does the future hold for them?" Well in the short term - that is through Q1- I think they are poised to continue to doing well. The announcement of the Pentium III put a real funk into the Wintel side of the market in February, a boon to Apple, and March looks better. Not only that, but the timing of the G3 advertising was excellent, hitting the market precisely when there was a dearth of PC advertising.

Longer term, it is clear that Apple has to start rebuilding share in business markets. This has happened a little bit in the small and medium business markets, but
Apple clearly needs to add some weight to marketing here, as well as likely

rebuild some burnt bridges with the smaller resellers. The CompUSA-based distribution
strategy has taken a hit as that chain has had its share of problems of late, and Best Buy is not really a business destination channel.

So far, Apple has done very well. Yet they are not at the point where they can rest on their laurels. We'll be watching the results here at InfoBead Insider to see if the positive trend continues.

I don't need a larger montior, but I would like to use an new 15" LCD digital
display. Can't the iStapler handle this?

My, my, seems that the iStapler is intended for a very specific user type. If
you had any brains, you would have guessed by now, that type of user does not
frequent this newsgroup.

>
> Because unlike Europe, trains are not available for a short distance between

I know nothing of trains in Europe. We do have a rail line that run close to
town. Why can't the iStaplers be shipped by rail? Don't brag about your
employment. Your about as laughable as Al Bundy. The "plus I get mileage"
statement really shows your mentality. It's like bragging about something
that everybody in outside sales receives. Your nothing special in that
respect. But you are a first rate Dick Head.

On 21 Mar 1999 06:01:57 , sinclair2246@my-dejanews.com (The iDiot Forever Known As Sinclap) wrote:

well, TiFKAS, I see that rather than face the issues (including posting real-world results on how well the iMac is doing in Canada, as well as facing the fact that neither the "Atari Jihads" nor your imaginary friend "Chunks" exists), you choose once again to mindlessly post a press release - and probably never bother to read it, in a desperate attempt to make everyone forget that you're way overdue to eat your strained spinach.

well, two can play at that game. Please note that the below press release does not include any reference to MIDI solutions to the iMac...:

Blue G3 - MIDI/Digital Audio update

Hello, I'm a producer who tries to stay on top of the technical aspects of electronic music. One of the big issues for a lot of us surround compatability with the new Blue G3. A friend of mine put together a list of information/issues that are important to MIDI/digital audio users. [...]

Jeff Taylor
Producer at Large

Re: BLUE G3s and MIDI/Digital Audio

There's no real solid solution on the MIDI front that I'm aware of other than a Megawolf PCI card and Mark of the Unicorn's FreeMIDI 1.38. If you don't use MOTU stuff you're going to have to wait until the Opcode's [USB MIDI adapters] ship or the PCI serial card companies come through...

Roland is leading the USB MIDI interface pack with the SuperMPU interface but there's no Mac MIDI driver for it yet.

Griffin Technologies has pushed back the release date for the gPort to the middle of March from the middle of February. The gPort connects internally to the Blue G3 motherboard with a special bracket to mount the serial port inside the case. The gPort provides only one Mac DIN 8 serial connector. When it's released almost all MIDI interfaces will work through it with the shipping version of Opcode's OMS (Open Music System 2.3.6).

A couple of serial PCI card companies will provide 2 to 4 Mac serial ports on a PCI card. An OMS compatibility solution for these PCI serial cards is in development by a third party and should be completed very soon. I can't comment on when until we know a little more about the situation.

USB OMS MIDI drivers are also in development. As soon as we get the drivers done the USB interfaces shouldn't be too far behind. Simple 2 to 4 port

interfaces will arrive first. Large multi-port, multi-function interfaces will follow later.

USB (12Mbps) is 50 times faster than older Mac serial ports (250Kbps) but more devices will probably be connected to the USB bus than with older Mac serial ports. Devices that don't work properly or that take up too much bandwidth can have a negative impact on other devices on the USB Bus.

A rumor circulating about claims that the current FireWire drivers that come installed on the new machines can't time stamp data making it less interesting for audio or MIDI data delivery. More on this when I find out more about it...

If this is truly the case, the Mac OS will probably be updated to include support in the near future, or the FireWire drivers will be updated to support MIDI and audio over FireWire.

Correct...but choose your G3 card VERY CAREFULLY. I have seen a very
recent list of available G3 cards and each different card might only work on a
particular series PowerMac ie...7200 or 7220. By no means was the list of
PowerMacs that CAN accept a G3 card a full list of existing PowerMacs...

...oh well, at least when an accelerator comes out for Falcon030 you know it
WILL work on Falcon030...

Sinclair P <sinclair2246@my-dejanews.com> whined about:

Hi TIFKAS, how's your head, still those pains?, well you realy got to
see a doctor soon....
>Apple never had to catch up...Constant updating

Did You say never ? When will the MAC OS be in 100% PPC code? When will
the MAC OS have a decent finder? why is it that after 4 years those
ingenious people that "think different" still haven't got it right?
Why is it that OS X, is based on a different OS? When wil the OS be
capable of preemptive multitasking, why is it that the moving sliders
were "stolen" from MagiC?

But there's hope. JINNEE 2.0 is able to launch MAC applications straight
from the desktop..... This means that for the first time ever a Mac user
will actually get to know what a real desktop is like, gone are the days
of the crummy Finder, lets go Jinnee, Lets do it the Atari way-))

YES, THE JIHAD CONSPIRACY is about to take place...first we get rid of
the crummy finder, next thing, before you know, the out of date Mac OS
is replaced by a modern and fast OS (MagiC)

>When Will TOS goto PPC?
Have you eaten your strained spinach ....?
Atari is going PPC in a couple of months, courtesy of Titan Design. These
guys are working hard on a add on card, up to 300Mhz PPC, real PPC power,
not crippled by a crummy OS

What did you say? YES, strained spinach is good against the pain in your
head, a dish a day wil keep the doctor away, now that's a good boy....

Cheers from Belgium

Dennis

This newsgroup is called comp.sys.ATARI.advocacy
^^^^^

It is NOT the place to post messages about iMacs or anything other than ATARI.
I'm quite frankly getting PISSED OFF by the messages in here that don't relate
to Atari.

Go and find another newsgroup, I'm sure there are loads of Mac newsgroups.

I have to second that, actually - the idea of, indeed, ANY
advocacy group on USENET is for the user of said system to vigourously
defend his particular choice of computer for his home or professional
use from those who feel that THEIR system is the better one. The same
is true of .mac.advocacy and .pc.advocacy . And indeed, I find many of
the arguments here that are presented are usually pretty thoughtful and
informative - at least I hope that mine are.

They can also, on occasion, be pretty funny, especially in TiFKAS'
case because his overblown rhetoric, mindless posting of press releases
and have-to-read-it-to-believe-it blowhard posturing in maintaining the
Steve Jobs Reality-Distortion Field® is UNINTENTIONALLY funny :) That's
where I come in, when I burst his bubble and show him up for the
pathetic ignoramous he really is. If he were a TRUE Mac advocate he'd
be butting heads with the PC crowd that regularly post their own
flamemail in .mac.advocacy (which there are many good people there who
do a great job, particulary Jayfar and Joe Ragosta); however, TiFKAS,
like Wile E. Coyote, has often kept up with his pursuits while
forgetting his original aim.....and usually has it explode in his face.

I'm sure TiFKAS is going to respond, probably again in a missive to
his imaginary friend "Chunks" - and when he does, I'm ready for him
with some interesting evidence that Ataris actually had some features
the current Mac OS (8.5) is claiming that they're innovators on (I just
got the latest copy of Atari Computing, Issue 12, and I'm loaded for
bear , muahahahahaha!)

I'm not sure why so many in this newsgroup get so frothed up over seeing Mr. Sinclair-Day posting iMac rhubarb into this newsgroup. He is doing things by the 'book' by posting to an 'advocacy' newsgroup. I quite frankly enjoy the spirited nature of replies that often make it into here. This is one of the more 'true' advocacy newsgroups I've read.

Also, I used to often bombard comp.sys.mac.advocacy and other newsgroups with similar (but based on REAL experience I have had of BOTH platforms - Mr.Sinclair-Day obviously hasn't!). Therefore I feel it is warranted for any Mac users to do the same here...

If it irks you don't subscribe...but remember together we Jihads stand!

Regards,
Chris Wilkinson,

[Article crossposted from rec.humor.funny]
[Author was Tim Rueger]
[Posted on Tue, 23 Mar 1999 19:30:00 PST]

Intel has recently run a commercial featuring Homer Simpson. He has his brain replaced with a Pentium chip; he is then able to design an advanced "super donut".

Apple just web-posted a video in which the HAL 9000 (from 2001: A Space Odyssey) extols the the Mac's Y2K readiness.

So it seems the choice is now: a PC with the brain of Homer Simpson, or a Mac recommended by an insane computer.

Now, where *did* I put that abacus...

Try this...

USB MIDI processing unit shipping
Staff Report, email@maccentral.com
March 23, 1999, 7:30 pm ET

Edirol North America -- the sales and support channel for Roland's Desktop Media Production group -- has begun shipping the Roland SMPU-64 USB/MIDI interface for iMacs and Blue G3s, according to iMacInTouch.

The SMPU-64 connects to any personal computer equipped with a USB connector. The digital connection offers "high-quality, low-noise" sound, says Edirol. The company says plug and play capability eliminates the need for the "annoying settings" required by personal computer connection (unlike ISA/PCI cards)

Power is supplied from a personal computer via the USB connector so no additional power supply is
needed. Since the interface don't use serial and parallel ports, it frees up ports allowing a modem and
printer to remain connected

The SMPU-64 has four MIDI Ins and four MIDI Outs that accommodate complex multitrack sequencing. There's an individual LED indicator for each MIDI In/Out port. The driver (supplied with the S-MPU64) features a Patch Bay function for utilizing S-MPU64 functions to the fullest extent. Edirol says that using a USB-equipped personal computer allows for the control of up to four S-MPU64 units at one time (64 x 4 = 256 tracks).

Retail pricing for the 64-channel device is US $250, but Edirol's site has it listed for $175.

Atari Enthusiasts...

This is to notify you of the recent reopening of the once-famous Atari Central message forums. Many of the original messages are still there and are now searchable. There's also a new Lynx message forum as well.

We are also currently offering an easy way for would-be Atari content providers to have material hosted at Ataricentral for free. We will also display free ads for non-profit pro-Atari ventures.

Hope you stop by. http://www.ataricentral.com

Particular Atari 8-bit game...

Yo! I'm looking for an old Atari 8-bit game. I recall this from my awesome childhood, but I can't remember the name and I vaguely recall the plot, but if I saw the graphics I'd recall it instantly.

I do recall that the game was made by Avalon Hill, I'm certain of it. Probably. I also remember that it was outer-space related or at least had a space background... The game scrolled in several directions since the main character dude had the potential of going in any direction. I think the word "Mission" was in the title. The title displayed was in dark blue blocks forming the letters. (I think...) I know the graphics weren't "conventional" like other games, there was a lot of palette swapping, and other unusual effects. It was an adventure game. Sound was pretty freaky, too. It had a psychedelic quality.

It's been bugging me ever since I found this cool Atari-8 emulator on the net... I can't find the game!

Wretched memory of mine, can anybody help me with this?

Thanks!

>>
>> nope - as a matter of fact, I visited Computer City today - plenty
>> of iMacs are in stock, in all colours....
>
>The typical Mac Jihad 'Chunks' thinks that having five units per color is high
>inventory...That was true in the Atari ST days....But thats nothing for iMac
>inventory..

1) no matter how much you try to invoke him, your imaginary friend "Chunks" does not exist. And now he's supposed to be a MAC Jihad?

2) it's still unsold inventory, TiFKAS - and according to your source at the National Pest, they were supposed to be "all out or hard to get" as of its publication date of March 3rd. It's March 26th and I'm still finding iMacs (in all five colours yet!) in a number of stores....

>
>> >
>> >> Computer Systems Centre (Spadina & College) - about 10 iMacs on the floor
>> >> in boxes, all five colours. Five iMacs on display on a round table -
>> >> strangely, all facing butt-out rather than screen out.
>> >
>> >Could be the empty shell display ones..
>> >Just 10 iMacs left? Thats nothing...50 on hand would indicate slow sales..
>>
>> that's just sitting on the floor - let's not also forget that they
>> also have stock areas in the back...
>
>And you have not finished the count. Go back and account for the units..

nope, how about coming up with REAL sales figures for Canada - after all, you ARE supposed to be a professional....

>
>> >
>> >Maybe a poor job in marketing and selling skills? Send then down south and
>> >will be gone in an hour..
>>
>> ahhh, dodging the issue - according to your article there should be

>> believe you were the one cackling about FutureShop carrying the iMac
>> and gloating that "they must be selling well".
>
>From what you have reported is true. There is little stocks of iMACS LEFT.

nope, it's still PLENTY of stock. Oh, by the way:

1) CompuCentre (the OTHER Canadian store you were gloating about
getting the iMac in Canada) has just started a sale to clear inventory.
Guess what? They have Rev. B iMacs in stock.

2) I just had an interesting conversation with my brother, the Mac
repairman, tonight - he says that it's absolutely no problem getting a
hold of a Rev. B, because Apple's warehouse happens to be FULL of them.
AAMoF, he's told me that Apple Canada is making special offers to his
store to purchase French-Canadian iMacs at a special reduced price. So
much for your fairy tales about empty warehouses. (BTW, Apple DOESN'T
EVEN HAVE A WAREHOUSE FOR CANADA ANYMORE - they're all shipped out from
the states....)

>>
>> too afraid to admit you made a boo-boo?
>
>Whats your definition of little to no units available? My defenition is 30
>units or less.

my definition is any inventory that can be easily found despite
flawed news reports that mindlessly parroted an Apple press release
that claimed "little to no iMacs can be found" dated March 3rd.

Too afraid to admit you made a boo-boo?

>>
>> or maybe it's the fact that there's really no driver support for
>> the iMac yet - that's according to a MIDI professional I talked to at
>> TAF last week. STILL no support for the new Roland USB-to-MIDI adaptor,
>> which seems to be the major player. Or maybe they're waiting for a

>> work with floppyless G3s (Cubase uses a key disc for the Mac - Jobs has
>> shot himself in the foot)
>
>Maybe you have looked in the wrong place...Try looking down south...for once!

Nah, you're the expert at it - you look "down south" so much you're
constantly wiping the sphincter marks from your neck!

But I DO check more reliable sources than famous disinformationists
like TiFKAS - like http://www.macintouch.com , which recently reported
that the main players for USB/MIDI support still haven't produced yet
for the iMac - and will now be APRIL before any product or drivers
show. PLUS I get the Club Cubase newsletter, which still hasn't
reported any progress on the Steinberg or the 3rd party parts on

getting Cubase to run on iMac or the G3 Tower (I got the latest one a
few days ago).

But one other thing that got me thinking - last reply you made a
crack about how I should ask people to bring these products in. Well,
shouldn't that be the responsibilty of Mac owners interested in these
products? I guess then it's either Mac owners have given up and gone
home, or that there just aren't any product for them to bring in. BTW,
Long & McQuades is considered a very cutting-edge music store chain in
Canada so they would certainly get in a new product if it were
available....

50Mhz CPU, 50Mhz FPU and 50Mhz RAM access on the Centurbo 2 rev.B

When you consider that a 16Mhz Falcon running MagiC 4 or even
just plain vanilla TOS seems quite a usable system you will appreciate
that a 50Mhz acceleration of the aforementioned devices will make the
Falcon seem to fly.

Two machines reside in the house I live in currently...my 16/32Mhz Falcon
with 16Mb RAM and a 200Mhz PowerMac 7220 with 32Mb RAM.

I have been rendering a view of my girlfriends kitchen to help her
choose colours to repaint her house. I've modelled it in POVray 3
and rendered it on both the Falcon and Mac at identical resolution/
quality/aliasing/etc... The PowerMac is only about 6 times faster
than the Falcon...My 030 is 32Mhz and 68882 is 16Mhz giving
about 1.25 times the float math speed of a normal 16Mhz Falcon.
Based on this the 200Mhz 603e in the PowerMac should be 8-10
times faster than the Falcon 030/882 combination but it ISN'T!

Why is this? Is it because MacOS 8 knocks the 603e too hard? :)

The answer is ni...But the line has expanded with new models on a annual
basis something the Jihads can't comprehend..High power and lower cost is the
norm in the mac market while you need a second income to purchase those TOS
clones..

Whats wrong with this picture? If you can figure it out I have an iMac light key chain to give out. I may have only grape left.

by Charlton Heston

Harvard Law School Forum February 16, 1999

I remember my son when he was five, explaining to his kindergarten class what his father did for a living. "My Daddy," he said, "pretends to be people."

There have been quite a few of them. Prophets from the Old and New Testaments, a couple of Christian saints, generals of various nationalities and different centuries, several kings, three American presidents, a French cardinal and two geniuses, including Michelangelo. If you want the ceiling re-painted I'll do my best. There always seem to be a lot of different fellows up here. I'm never sure which one of them gets to talk. Right now, I guess I'm the guy.

As I pondered our visit tonight it struck me: If my Creator gave me the gift to connect you with the hearts and minds of those great men, then I want to use that same gift now to re-connect you with your own sense of liberty ... your own freedom of thought ... your own compass for what is right.

Dedicating the memorial at Gettysburg, Abraham Lincoln said of America, "We are now engaged in a great Civil War, testing whether this nation or any nation so conceived and so dedicated can long endure."

Those words are true again. I believe that we are again engaged in a great civil war, a cultural war that's about to hijack your birthright to think and say what resides in your heart. I fear you no longer trust the pulsing lifeblood of liberty inside you ... the stuff that made this country rise from wilderness into the miracle that it is.

Let me back up. About a year ago I became president of the National Rifle Association, which protects the right to keep and bear arms. I ran for office, I was elected, and now I serve ... I serve as a moving target for the media who've called me everything from "ridiculous" and "duped" to a "brain-injured, senile, crazy old man." I know ... I'm pretty old but I sure Lord ain't senile.

As I have stood in the crosshairs of those who target Second Amendment freedoms, I've realized that firearms are not the only issue. No, it's much, much bigger than that.

I've come to understand that a cultural war is raging across our land, in which, with Orwellian fervor, certain acceptable thoughts and speech are mandated.

For example, I marched for civil rights with Dr. King in 1963 -- long before Hollywood found it fashionable. But when I told an audience last year that white pride is just as valid as black pride or red pride or anyone else's pride, they called me a racist.

I've worked with brilliantly talented homosexuals all my life. But when I told an audience that gay rights should extend no further than your rights or my rights, I was called a homophobe.

I served in World War II against the Axis powers. But during a speech, when I drew an analogy between singling out innocent Jews and singling out innocent gun owners, I was called an anti-Semite.

Everyone I know knows I would never raise a closed fist against my country. But when I asked an audience to oppose this cultural persecution, I was compared to Timothy McVeigh.

From Time magazine to friends and colleagues, they're essentially saying, "Chuck, how dare you speak your mind. You are using language not authorized for public consumption!"

But I am not afraid. If Americans believed in political correctness, we'd still be King George's boys-subjects bound to the British crown.

In his book, "The End of Sanity," Martin Gross writes that "blatantly irrational behavior is rapidly being established as the norm in almost every area of human endeavor. There seem to be new customs, new rules, new anti-intellectual theories regularly foisted on us from every direction. Underneath, the nation is roiling. Americans know something without a name is undermining the nation, turning the mind mushy when it comes to separating truth from falsehood and right from wrong. And they don't like it."

Let me read a few examples. At Antioch college in Ohio, young men seeking intimacy with a coed must get verbal permission at each step of the process from kissing to petting to final copulation ... all clearly spelled out in a printed college directive.

In New Jersey, despite the death of several patients nationwide who had been infected by dentists who had concealed their AIDs --- the state commissioner announced that health providers who are HIV-positive need not .. need not ... tell their patients that they are infected.

At William and Mary, students tried to change the name of the school team "The Tribe" because it was supposedly insulting to local Indians, only to learn that authentic Virginia chiefs truly like the name.

In San Francisco, city fathers passed an ordinance protecting the rights of transvestites to cross-dress on the job, and for transsexuals to have separate toilet
facilities while undergoing sex change surgery.

In New York City, kids who don't speak a word of Spanish have been placed in bilingual classes to learn their three R's in Spanish solely because their last names sound Hispanic.

At the University of Pennsylvania, in a state where thousands died at Gettysburg opposing slavery, the president of that college officially set up segregated dormitory space for black students.

Yeah, I know ... that's out of bounds now. Dr. King said "Negroes." Jimmy Baldwin and most of us on the March said "black." But it's a no-no now. For me, hyphenated identities are awkward ... particularly "Native-American." I'm a Native American, for God's sake. I also happen to be a blood-initiated brother of the Miniconjou Sioux. On my wife's side, my grandson is a thirteenth generation native American ... with a capital letter on "American."

Finally, just last month ... David Howard, head of the Washington D.C. Office of Public Advocate, used the word "niggardly" while talking to colleagues about budgetary matters. Of course, "niggardly" means stingy or scanty. But within days Howard was forced to publicly apologize and resign.

As columnist Tony Snow wrote: "David Howard got fired because some people in public employ were morons who (a) didn't know the meaning of niggardly,' (b) didn't know how to use a dictionary to discover the meaning, and (c) actually demanded that he apologize for their ignorance."

What does all of this mean? It means that telling us what to think has evolved into telling us what to say , so telling us what to do can't be far behind.

Before you claim to be a champion of free thought, tell me: Why did political correctness originate on America's campuses? And why do you continue to tolerate it? Why do you, who're supposed to debate ideas, surrender to their suppression?

Let's be honest. Who here thinks your professors can say what they really believe? It scares me to death, and should scare you too, that the superstition of political correctness rules the halls of reason.

You are the best and the brightest. You, here in the fertile cradle of American academia, here in the castle of learning on the Charles River, you are the cream. But I submit that you, and your counterparts across the land, are the most socially conformed and politically silenced generation since Concord Bridge.

And as long as you validate that ... and abide it ... you are-by your grandfathers' standards-cowards.

Here's another example. Right now at more than one major university, Second Amendment scholars and researchers are being told to shut up about their findings or they'll lose their jobs. Why? Because their research findings would undermine big-city mayor's pending lawsuits that seek to extort hundreds of millions of dollars from firearm manufacturers.

I don't care what you think about guns. But if you are not shocked at that, I am shocked at you. Who will guard the raw material of unfettered ideas, if not you? Who will defend the core value of academia, if you supposed soldiers of free thought and expression lay down your arms and plead, "Don't shoot me."

If you talk about race, it does not make you a racist. If you see distinctions between the genders, it does not make you a sexist. If you think critically about a
denomination, it does not make you anti-religion. If you accept but don't celebrate homosexuality, it does not make you a homophobe.

Don't let America's universities continue to serve as incubators for this rampant epidemic of new McCarthyism.

But what can you do? How can anyone prevail against such pervasive social subjugation?

The answer's been here all along. I learned it 36 years ago, on the steps of the Lincoln Memorial in Washington D.C., standing with Dr. Martin Luther King and two hundred thousand people.

You simply ... disobey. Peaceably, yes. Respectfully, of course. Nonviolently, absolutely. But when told how to think or what to say or how to behave, we don't. We disobey social protocol that stifles and stigmatizes personal freedom.

I learned the awesome power of disobedience from Dr. King ... who learned it from Gandhi, and Thoreau, and Jesus, and every other great man who led those in the right against those with the might.

Disobedience is in our DNA. We feel innate kinship with that disobedient spirit that tossed tea into Boston Harbor, that sent Thoreau to jail, that refused to sit in the back of the bus, that protested a war in Viet Nam.

In that same spirit, I am asking you to disavow cultural correctness with massive disobedience of rogue authority, social directives and onerous law that weaken personal freedom.

But be careful ... it hurts. Disobedience demands that you put yourself at risk. Dr. King stood on lots of balconies.

You must be willing to be humiliated ... to endure the modern-day equivalent of the police dogs at Montgomery and the water cannons at Selma.

You must be willing to experience discomfort. I'm not complaining, but my own decades of social activism have taken their toll on me. Let me tell you a story.

A few years back I heard about a rapper named Ice-T who was selling a CD called "Cop Killer" celebrating ambushing and murdering police officers. It was being marketed by none other than Time/Warner, the biggest entertainment conglomerate in the world.

Police across the country were outraged. Rightfully so-at least one had been murdered. But Time/Warner was stonewalling because the CD was a cash cow for them, and the media were tiptoeing around it because the rapper was black. I heard Time/Warner had a stockholders meeting scheduled in Beverly Hills. I owned some shares at the time, so I decided to attend.

What I did there was against the advice of my family and colleagues. I asked for the floor. To a hushed room of a thousand average American stockholders, I simply read the full lyrics of "Cop Killer"-every vicious, vulgar, instructional word.

"I GOT MY 12 GAUGE SAWED OFF I GOT MY HEADLIGHTS TURNED OFF I'M ABOUT TO BUST SOME SHOTS OFF I'M ABOUT TO DUST
SOME COPS OFF..."

It got worse, a lot worse. I won't read the rest of it to you. But trust me, the room was a sea of shocked, frozen, blanched faces. The Time/Warner executives squirmed in their chairs and stared at their shoes. They hated me for that.

Then I delivered another volley of sick lyric brimming with racist filth, where Ice-T fantasizes about sodomizing two 12-year old nieces of Al and Tipper Gore.

"SHE PUSHED HER BUTT AGAINST MY ...."

Well, I won't do to you here what I did to them. Let's just say I left the room in echoing silence. When I read the lyrics to the waiting press corps, one of them said "We can't print that." "I know," I replied, "but Time/Warner's selling it."

Two months later, Time/Warner terminated Ice-T's contract. I'll never be offered another film by Warners, or get a good review from Time magazine. But disobedience means you must be willing to act, not just talk.

When a mugger sues his elderly victim for defending herself ... jam the switchboard of the district attorney's office.

When your university is pressured to lower standards until 80% of the students graduate with honors ... choke the halls of the board of regents.

When an 8-year-old boy pecks a girl's cheek on the playground and gets hauled into court for sexual harassment ... march on that school and block its doorways.

When someone you elected is seduced by political power and betrays you ...petition them, oust them, banish them.

When Time magazine's cover portrays millennium nuts as deranged, crazy Christians holding a cross as it did last month ... boycott their magazine and the
products it advertises.

So that this nation may long endure, I urge you to follow in the hallowed footsteps of the great disobediences of history that freed exiles, founded religions,
defeated tyrants, and yes, in the hands of an aroused rabble in arms and a few great men, by God's grace, built this country.

If Dr. King were here, I think he would agree.

Thank you.

Peter S.

again propogating an untruth. The Milan costs $899 US, even less when
you buy the motherboard and "roll your own". And it includes standard
ports, a nice modern operating system and PCI card slots.

And all this coming from a self-proclaimed "expert" who admits his
only ST experience comes from a single use of a machine with TOS 1.0 -
and who constantly mistakes his Mac for his manhood.

>has it listed for $175.

That's one of the 12000 3th party products, where are the 11999 others?

BTW: This is what I call misleading information.....
The press release clearly states that its for USB equiped personal
computers... Its here allright, but no MAC version in sight yet....
You see TIFKAS, to drive it you need drivers, gues what, no MAC drivers
included-)

Why should Roland go to the trouble writing them anyway ?
There's no decent MIDI software on the Mac platform for this device, and
firms like Steinberg and EmagiC have made it quit clear that they will
not support the crummy machine you love so much....why would that be?
The machine that is according to you selling like hot cakes, and none of
the big boys want to support it....

So, go and get the USB Midi processing unit, write your own driver and
while you're at it write your own version of Cubase..... that's what I
like about Mac Users...they think different.

Cheers from Belgium
Dennis

Typical SinDrop response.

So you would still accomplish the job if your marketing led to no/low sales
being made by Apple distrubitors? (This thread is beginning to not make sense
after you cut out parts that you failed to dispute earlier, Dick Head).

BTW, the Commander of NAWCWDPS emailed a statement concerning no new purchases
of Apple machines for the NAVY (NAVAIR). He stated that he has made the
transition over to NT, and is really satisfied with the move, and is sure that
all NAVAIR employees will feel the same.

Why don't you take your superior marketing efforts to NAVAIR? Or is that not
your zone? I would really like to see a dweeb like you try to promote a
failing platform to the Dept of the NAVY......

Well in my dictionary Advocacy is defined as "one who pleads the case for"
and in the context of "Atari Advocacy" equals "one who pleads the case for
Atari".

This is why I object to the messages about iMacs, as they DO NOT even
attack Ataris, nor even mention Ataris.

Were you here watching it? There is NO error and I am definitely NOT
imagining things. I created the scene file, a special include file defining
colours from a scanned colour chart, some image maps etc...on the
Falcon, rendered it at 640x480, and then imported the lot via floppy
to the Mac, and re-rendered it at the exact same res/aliasing/quality etc...

The only difference I noted between the 2 final TGA files was a small
difference in random seeding for some nice woodgrain textures I had
created.

Of course 6 times faster is significant, but I just would have expected
more from a 200Mhz CPU, especially for float math!!

Regards,

Chris Wilkinson,

So what? Atari designed in MIDI ports when the ST was designed in
1983-1984, thus creating the World's No.1 computer for music, which it
still is.

And still the other computer manufacturers still don't see the need to
provide them as standard. As long as they do that, Ataris will rule.

Cheers!

James

But that was what I was saying: we don't have a FREE LOCAL CALLING ISP in the UK. We have to pay for every second that we are online. Local calls are all charged for by the phone companies. Yes we have ISPs that have local access, an ISP wouldn't last long if they didn't. But this is why the North Americans are more into the Net than we are. Which also explains why Ataris are more in use here than in the States, as we have more costs than you.

Cheers!

3575. 520 ST TOS 1.0 RULES

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-28 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <novL2.238$c97.371@198.235.216.4>
Source record: 3538

The Atari 520ST is the most multi purpose multi functional computer ever made for the home computer market in 1985.

Today in the year 1999 the Atari 520 ST is still being used on a daily basis by users who chose to purchase Atari over the lesser brands and more expensive brands.

While other less educated users have paraded through a long line of newer computers trying to keep up to date the ST remains a Stable element to all Atari users.

Clearly no other computer from 1985 has survived the test. When purchasing a computer that won't be obsolete, the ST has proven that the life span of a computer is not 2 years, but that it is 15 years and more.

Where are the expensive Macs of yesterday, today? While once considered the leading edge, clearly all Expensive macs have proven that you have merely flushed your money down the toilet.

IBMPC compatibles of the same era are long gone into the bit bucket. Not capable of anything then, today they merely show up in the technological waste bin.

Amiga? Strange but true the 1000 Amiga was both expensive and rough around the edges. Long an Atari adversary, the amiga was a failure in its early incarnation and early users paid a hefty price for that 256 k machine.

But the 520ST with all of its faults in its rush to the market, truly was the best compromise in all things computing. Proof is in the fact that no other computer from that era has software written for it in todays market.

How could one ever complain of a computer where you can get NEW software 15 years after it release. This software allows for all the modern uses that they current platforms demand.

Clearly computers 2 years old are having difficulty running the latest software for their OS, resulting in forced obsolescence of computers with superior hardware and processing power to the ST.

And while the ST is capable of running MINT/GENEVA/TOS/and Magic it is really Magic that makes the ST fly while multi tasking. This premptive software is found on many Ataris and not even found on current Mac platforms from the warehouse. They are still living in the cooperative state.

Like the Mac of its day the ST has a monochrome monitor. Unlike the Mac of its day the ST can surf the WEB. And it can surf the WEB with the FIRST VERSION OF TOS Also unlike the Mac the ST has COLOUR. This allows web

browsing in Monochrome, 16 colours or grayscales. While this may not sound impressive by todays standards, the results on screen are respectable. Other computers from this era CAN'T DO IT PERIOD.

A computer of 1985 specs being able to WEB BROWSE handle JPEG and MPEG compression as well as being flexible enough to interact with every platform makes this computer clearly the computer of choice for any purchase in the year 1985. If only they had the hindsight.

However really impressive is the STs ability to play:
AVS, AVI, DLT, MOV, QT, SEQ, FLM, FLI, SPS and MANY MANY MANY MANY MANY more animations found on the internet.

Today a 520ST is the CHEAPEST internet computer available. Technical help on comp.sys.atari.st is more advanced than can be found in any computer store.

And it gets better. The ST is the lowest common denominator. It can do it all. It does all functions with very respectable speed. The ST is the sportscar of computing.

After the ST the rest of the Atari line offer improvements that enhance using your TOS based software.

MegaST
STe* WOW 24BIT FILES RENDERED WITH PHOTOCHROME!!! Super Results. Huge files:-).
TT
MegaSTe
Falcon

15 years later and my ST is clearly the best computer I have every purchased.

I use it for all my computing needs.

As for the Mac user who once claimed to owning an Atari, and always is asking if a "520ST" can do this or that.

Start with
http://www.rhein-main.de/people/robert/index.htm
then grab the UDOIT ST Files.

These are some hardware mods that advance a 520ST to more modern specs from its 1985 roots. However my 520ST short of 2 megs of Ram I put in in 1987 is bone STOCK.

Comparing the Imac to an ST is silly. One computer has a cult status and a large software selection and some dedicated users as well as some very trick optimised software. The ST can also be found for AS MUCH AS $20 US:-).

The other computer is obsolete and will be known for its significants as being the last nail in the coffin of Apple computing.

Too different, too little, too late.

Perhaps it is time to find a used ST and join in on the fun of having an Atari. They are easy to use. But really it is the people who make it fun.

With the Atari, the computer speaks for itself and the egos are left at the keyboard. There is little to brag about because it just does it. Thats it, thats all, its that simple.

Later Brian.

3576. Revised FS 520ST (U.S.A. only)

Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

3577. iMac compared to Falcon..

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-29 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <iKEL2.8698$5p5.6206@news1.telusplanet.net>
Source record: 3540

Well I just subscribed to this group and had a good laugh reading
some of these messages. Here is what I have to say:
I own a Nemesized Falcon030 and a MegaSTE
I also own a Revison B iMac
and a Pent233..

Which one of these do I like best?
The Falc ofcourse! Its actually fun and cute to use, and handles
alot of things much better then any of the other computers.
For example, On all of the Usenet Readers in order to subscribe
to a group you must download the complete group listing, but with
Newsie for example, if you already know the name of the group,
just click on subscribe and type it in. Although this seems
small, there are many littlie things like this that can drive you
crazy.
I do use magiCMac on the imac quite a bit, and the jinne desktop
is faster then finder and has way more features. It's like Night
and day..

really, there is nothing I do on the imac or pc that I cant do
just as well, and easier on my falcon except for overated crap
such as mp3 (Which faster falcons can do..) and S**t games which
I don't play anyways.
Anyways.. I should get to bed
Bengy

3578. New Episode of Back In Time radio

Newsgroup: comp.sys.atari.advocacy
Date: 1999-03-29 00:00:00 UTC
From: mstulir@geocities.com
Message-ID: <7do5on$9rd$1@nnrp1.dejanews.com>
Source record: 3541
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st,rec.games.video.atari

The new episode of Back In Time has been posted. This episode features an extensive interview with Curt Vendel, curator of the Atari Historical society. Curt and I discuss all aspects of Atari history. This is the longest show to date. (Just over 40 minutes.)

To stream the show through the Internet, click on the GT2K option on the Back In Time web site.

Due to multiple requests, I have also set up an archive of all of the shows, including the new episode. These may be downloaded for offline listening. To access these shows, click on the "Radio Show Archive" option at the Back In Time web site.

All aspects of audio quality have been improved on this new show. The Real Audio player is required to hear the shows.

The next episode will feature Dana Henry, Public Relations Director for Hasbro Interactive. That episode should be posted sometime around Sunday April 11th. We will discuss Hasbro's plans for the Atari properties, the BattleSphere situation, and their recent classic game updates such as Frogger and Centipede.

The Back In Time mailing list has been set up. Be sure to sign up, and have the latest classic gaming/computing news and information sent directly to you via E- Mail.

The Back In Time website has been through some changes in the last few days to fix some font and color issues with Netscape Navigator. If you are using Navigator, the site should look better now.

Hmm, nope, everything is correct as posted. Perhaps you could tell me what part confuses you. It is posted with a post marketing enthusiasm that is simply meant to catch ones attention. The facts are the facts. I would be suprised if you used an ST on the internet? In fact I haven't even posted anything outrageous. I am merely stating what my STock 520ST is easily capable of. I certainly never mentioned MP3 nor Java. Then I might be caught with some serious embelishment flaws.

I can only think of two possible answers to your rude reply.

1) You are an ignorant (lacking in knowledge) user of more powerful Atari equipment and you have failed to include the ST in your thought process.

2) You are a user of another platform and quite frankly are clueless. Normally these people own IBM PCs and MS products, however these users usually know nothing of Ataris nor can they be bothered trying to find out anything about them let alone waste valuable bandwith replying. Therefore you are most likely a NON INTEL user. Leaving only Amiga and Mac. Amiga users have bigger problems of their own than to worry about Atari, and the Amiga Atari wars, while Great as they were are now part of OS history. Therefore you are a Mac user with limited knowledge.

Luckily for me I have been winning bets and now I am on my second year of FREE INTERNET ACCESS for merely hooking up and using my ST on the internet. No big deal.

Since you are rude , while I am only trying to have some fun in comp.sys.atari.advocacy I think you have received more of an answer then you deserve.

I am no fool.

Dead? Bollocks - a dead platform is one that doesn't have any users or support for it. There are thousands of Atari users all over the world, doing virtually anything that a PC or a Mac could do, and for a lot less money too. Support? Well there are loads of companies and individuals producing new software and hardware.

Cheers!

James

Um, if the company who made the platform no longer exists, I'd say it's dead.

True.

I hope you studied A-level electronics. When the components die of entropy-related reasons, you'll need to whip up a replacement component. Unlike death, taxes, and Reaganomics, things don't last forever.

I must agree. I for one keep three gerbils, eight parrots, two cats, seven dogs, a penguin, and a ferrett up my slacks. And all of them are as "dead" as the platforms Ronald has suggested. I killed the penguin myself, the damn thing reminds me of that retarded-looking linux logo.

He could use an A3000, though. I've got one for sale... :-)

And bollocks to that! There's no Atari in existence which can do 3d rendering at 32-bit high-resolution at an acceptable pace. Not even the ST could! Heck, I prefer the Amiga by far... it could do such rendering, especially if you added an upgraded video card, but why? Truespace 4 (8th generation product which started on the Amiga in 1985 moved to Wintel by 1994 when Commodore snuffed it) on a Windows PC is so much more developed.

As for banal word processing, even a Sinclair ZX-81 could do such work. At a pitiful 40 columns text, but nobody is perfect. And more recent software has features not to be found in the 'good ol' days'.

Oh, what happens when the 20 year old circuitry finally burns out? Most electronic chips have a physical lifespan of 10 accumulated years (24 hours day/7 days week). Nobody's making any more GTIA chips, the last I heard.

Brian Van TIlborg wrote:

> The Atari 520ST is the most multi purpose multi functional computer ever
> made for the home computer market in 1985.

You ought to go into comedy, you've made me laugh rather hard. The Amiga used less memory and did a hell of a lot more. The ST is made of generic rubbish chips whereas the Amiga was specially designed to do all sorts of wonderful things. And both had cost around the same price.

>
> Today in the year 1999 the Atari 520 ST is still being used on a daily
> basis by users who chose to purchase Atari over the lesser brands and more
> expensive brands.

Uh-huh. Last I heard, you couldn't get a new Atari ST since 1994 (were all ST-type computers discontinued in 1993, as I had heard?) You must opt for a used model, which means its lifespan is somewhat limited.

>
> While other less educated users have paraded through a long line of newer
> computers trying to keep up to date the ST remains a Stable element to all
> Atari users.

Right... if any computer could *really* be compared to today's computers, the Amiga is the only one. It pre-emptively multitasks. Screw that, it does multitask. The Amiga has 4 independent CPUs whereas PeeCees, Crapintoshes and STd's have but one. The only OSes which could compare to the Amiga are OS/2 (which is a bloated waste of time) and BeOS (which deserves to be the future, not bloatware NT which is sluggish by far in comparison). With the native ECS or AGA chipsets, the amount of things you could do with video and the workbench desktop are staggering. The ST up to date, stop making me laugh! The ST audio is shite, too. And Amiga's 8-bit audio is still viable. Amiga's FM synth is equal to PeeCee's MIDI. Since PC FM synth is still shite and will always be shite,Uncreative Labs (the 'standard') decided to have everybody rely on big-ass bloated .WAV files - almost as bad as raw sound sample data in terms of size. When PeeCee users say the sound is better than the Amiga, they don't take this small reality into account. PeeCee rules because of a damn recording, not real effort on the part of hardware. The SB Live product is finally duplicating some Amiga audio features like the ability to play several sounds simaultaneously from multiple programs (took 14 bloody years, though!)

Liar liar, wiener on fire. Go study up on the Amiga.

>
> Where are the expensive Macs of yesterday, today? While once considered the
> leading edge, clearly all Expensive macs have proven that you have merely
> flushed your money down the toilet.

For once, I agree. The Mac really hasn't been updated for 8 years. MacOS 8
adds colorful backgrounds and other useless rubbish, but it does NOT address
true multitasking or crash protection! Ouch! There's no way I'd ever invest
in Apple if this is how they operate. Why did Microsoft even bother with them,
I don't know...

>
> IBMPC compatibles of the same era are long gone into the bit bucket. Not
> capable of anything then, today they merely show up in the technological
> waste bin.

I totally agree. IBM designed the PC with generic hardware and inferior
technology. The Intel 808x (8 or 6) were designed badly "brain damaged" has
been used to describe the chip. IBM knew their computer would sell because of
their name. They had a monopoly on midrange computers. They wanted to ensure
that no desktop PC could ever rival a midrange so they made it with crap. Of
the day, there were far superior 8-bit chips available. And the Motorola 68000
did exist in 1981, which was a coherent design unlike Intel's offerings. IBM
could have been 4 years ahead of its time by introducing a Motorola CPU-based
system, but no. They had to be shitheads. I'd love to go back in time and
castrate the fathers who allowed their offspring to design the PC... then we'd
have something better to nitpick.

>
> Amiga? Strange but true the 1000 Amiga was both expensive and rough around

> incarnation and early users paid a hefty price for that 256 k machine.

Bollocks! The Amiga 1000 was half the price of your comparable 80286 IBM PC.
where the hell are you getting your figures: Drunk-Accountants-r-us? The
fucking thing may have cost more than the Atari ShiT, but the Amiga had
multiple processors which were specially designed. The ST, like Mac and IBM,
were made with generic hardware.

>
> But the 520ST with all of its faults in its rush to the market, truly was

Like so many IBM and Microsoft people have said, it is better to have a product
in the market, regardless of quality, than having no product while working out
its bugs. Blame capitalism, I'll be happy to. Your proof, btw, is conjecture.

>
> How could one ever complain of a computer where you can get NEW software 15

> platforms from the warehouse. They are still living in the cooperative
> state.

hahahahahahahahahaha! TOS is Jackie Tramiels' crap version of DOS. And GEM came from a different company. Atari was so lame they couldn't write their own OS! IBM was just as bad! And the ST does not pre-emptively multitask. Like the Mac, Win 3.x/95/98, and so on, the ST co-operatively multitasks. In other words, it doesn't multitask. What the hell is this Magic rubbish anyway? A replacement OS for the ST which won't run current ST software?

>

> Other computers from this era CAN'T DO IT PERIOD.

STOP THE BLOODY YELLING YOU TWIT! Proof, please, on how the ST surfed the web. The web was still classified by the military. And more Amigas got into top-secret US installations than STs. Yeah yeah, the ST of 1985 had color. So did the Amiga. So did the PC, for whatever that was worth. Big frigging deal. God, stop being an imbecile! "Other computers from this era CAN'T DO IT PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise, the Amiga of the time did 4096 colors at once! Your ST couldn't get ANYWHERE NEAR THAT! I may be slightly ignorant on the ST, but you are way off your rocker in terms of comparing the Amiga to the ST...

You're right. It's cheap. it's a useless pile of shit.

>
> And it gets better. The ST is the lowest common denominator. It can do it
> all. It does all functions with very respectable speed. The ST is the
> sportscar of computing.

You mean it gets more amusing. The ST's interface is the most backwards I've ever used. Same rubbish was made for DOS until Apple sued the makers of GEM for releasing it on DOS (but why not Atari...)... Even the Mac was easier to use.

>
> After the ST the rest of the Atari line offer improvements that enhance

Voice synth? I never knew the ST could do that. For 1985 the Amiga could... your entire post sounds like a brag, what the hell are you implying by your comment that there's little to brag about? Unless the ST is such a little pointless piece of paltry silicon, of course.

Well, you're going to get a lot more replies than you deserve. You borderline the level of a troll. And trolls ought to be avoided, not indulged with responses.

--- original post with my reality-oriented comments.

Brian Van TIlborg wrote:

> Hmm, nope, everything is correct as posted.

In your opinion... I'm not perfect either, but reality can prove us both wrong. It'll prove you wrong just a little more quickly. :-)

> Perhaps you could tell me what
> part confuses you. It is posted with a post marketing enthusiasm that is
> simply meant to catch ones attention.

It is not enthusiasm when you run around blindly criticising other computer brand without having a proper knowledge of them. If you do know the competing brands and lie or not specify certain information, it makes you look like a real gastropod (slug). With luck nobody else will catch that attention. You were mostly right about the Mac, tho.

> The facts are the facts.

Well, you've omitted or lied on a couple of them - hopefully out of ignorance and not out of sheer deception. I don't like deception, you see...

> I would be
> suprised if you used an ST on the internet? In fact I haven't even posted
> anything outrageous. I am merely stating what my STock 520ST is easily
> capable of. I certainly never mentioned MP3 nor Java. Then I might be
> caught with some serious embelishment flaws.

So bloody what? Many people use Amiga 500s on the 'net, too - and they can more accurately draw the pics than your ST because of greater color depths. And that's a fact.

Define outrageous!

> I can only think of two possible answers to your rude reply.

Well, when you make a rude post, do you expect candy and roses?!

>
> 1) You are an ignorant (lacking in knowledge) user of more powerful Atari

> equipment and you have failed to include the ST in your thought process.

Takes one to know one and you've definitely shown ignorance, unless you lied and I've said I don't like people who attempt to deceive in order to improve their own status...

>
> 2) You are a user of another platform and quite frankly are clueless.

Well, should that really matter regardless of the truth? I dare say he may be wrong on the drugs, but you're definitely acting odd and your delightful comment about "I can only think of two possible answers to your rude reply" since your post was extremely rude and inaccurate merely makes some wonder if you actually are... or just plain nuts. Amiga nazis, Linu-nazis, os/2-bigots, and the type for every platform do exist. You're nuTS. (TS backwards is rather deliberate. :-))

> Normally these people own IBM PCs and MS products

Well, I currently have a PeeCee clone and BeOS, WinNT 4, Linux (which I don't use since it's crap), and OS/2 4. I also have an Amiga 500 and 3000. I used to own several Atari 8-bit models. I nearly bought an Atari ST -- and then I saw the Amiga... bloody glad I didn't buy the ST.

> , however these users
> usually know nothing of Ataris nor can they be bothered trying to find out
> anything about them let alone waste valuable bandwith replying.

Um, your ignorance prejudice is showing AGAIN. Kindly stop the prejudice or stop wasting valuable bandwidth posting (and replying).

> Therefore
> you are most likely a NON INTEL user.

You'd better be right in your guesses! You're definitely wrong about me since you think that just because I own and use a PC with Windows NT on it that I'm totally ignorant of everything else that time has presented.

> Leaving only Amiga and Mac. Amiga
> users have bigger problems of their own than to worry about Atari, and the
> Amiga Atari wars, while Great as they were are now part of OS history.
> Therefore you are a Mac user with limited knowledge.

Possible. You did make the biggest attacks on the Mac. And I must admit, I'm not fond of the Mac...

>
> Luckily for me I have been winning bets and now I am on my second year of
> FREE INTERNET ACCESS for merely hooking up and using my ST on the internet.
> No big deal.

Aw, man! I've got a year's worth of hair-removal wax kits! You're boasting again...

>
> Since you are rude

I can't imagine why he was...

> , while I am only trying to have some fun in
> comp.sys.atari.advocacy

Yup. Fun is defined by starting a new thread which unjustly puts down others (by accident or by design) in order to raise your own status. Don't worry. You'll get a lot more rude posts. Not by me. I've had all I need to say regarding this, unless you make a really good response to all this!

> I think you have received more of an answer then
> you deserve.

Well, you're going to get a lot more replies than you deserve. You borderline the level of a troll. And trolls ought to be avoided, not indulged with responses.

> I am no fool.

That's debatable!

And bollocks to this! ('scuse me while I scratch mine :). Some Ataris exist that
can handle this. A TT for example renders POV-ray scenes quite rapidly. A Falcon
is acceptable too. Then of course a Hades060 is 30 times faster than a Falcon with
POV-ray! Video oriented software is a strong point for the Amiga, but I ask
you to
define an acceptable pace. 'Proper' rendering software is slow on ANY computer that
doesn't have a 6 figure price tag...if it isn't slow then it cheats and the quality
of output reflects thus...

You had the guru meditation, we had the bombs ... have you ever heard the story about how the amiga concept was bought by commodore just hours after atari thought of buying it? Atari Corp had a contract and the amiga guys did not want to sign it right away. Commmodore put two bottles of booze up and the guys signed shortly afterwards.

Correct, there are only Falcon/TT clones today and the ST wasn't manufactured after the Falcon was introduced, I think with exception for some STe's. How many Amiga clones exist today? And how many laptops were made?

You are talking of CPU's here? Not co-processors wich the Amiga AND about every other M68K-based computer has? But if you really mean CPU's then you should know multiple CPU's has been used in PC's and Mac's already, but not in Atari's as of yet. Not that Amigas have used multiple CPU's yet either as of what I've heard. And guess what, despite what you think, the multitasking of Magic and MiNT is *real*

and pre-emptive.

BeOS lacks applications, NT is old, MacOS is sluggish. Windoze isn't
even operatable. Say, how is it to use the good'ol interlaced
flickering workbench? You got all the apps you could ever want eh? I
use to laugh every time I watch my pal use his amiga for real coding.
The guy know how to code but the enviroment he's in looks like a
flickering piece of shit. I would have to say the much more up-to-date
OS's of the Atari looks, ah let's say - a bit better.

The Falcon has outstanding audio, the ST had one drawback and that was
that it had only mono. The midi however made Atari the industry
standard music machine. It has been said by musicians that even todays
Mac's and PC's have a hard time to beat the accurate midi timing of
the good'ol ST.

>> Clearly no other computer from 1985 has survived the test. When purchasing

>fucking thing may have cost more than the Atari ShiT, but the Amiga had
>multiple processors which were specially designed. The ST, like Mac and IBM,
>were made with generic hardware.

ST? Generic hardware, true. Multiple processors true. Multiple CPU's
nope - neither did amiga/PC/Mac at the time. The amiga was more of a
hardware hack than indusustrial design.

<Market part cut out>

<new softwares part cut out>

<strange part cut out>

<cut>
>hahahahahahahahahaha! TOS is Jackie Tramiels' crap version of DOS. And GEM
>came from a different company. Atari was so lame they couldn't write their own

>replacement OS for the ST which won't run current ST software?

Bullshit. GEM was made by Digital ... a better buy than to hire some
freaks to hack together some sheit. Pre-emptive multitasking has been
around for a while.

<some stuff cut out>
>PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise,
>the Amiga of the time did 4096 colors at once! Your ST couldn't get ANYWHERE
>NEAR THAT! I may be slightly ignorant on the ST, but you are way off your
>rocker in terms of comparing the Amiga to the ST...

The amiga had 32 colours, the ST 16. Special techniques allowed 4096
colours on old amigas and 512 colours to be displayed on old ST's.

<arguments cut out>
>Go get a date. You need one worse than I do.

<more quite good arguments cut out>
>Masturbate first, then go get a date. You really sound frustrated!

I must tell you, this sounds not as much as riddiculing, more like you
are out of arguments and has given up ;)

The Mac is the easiest computer on the planet to use, it's a fact. The
old ST operating system is as inspiring as the old amiga workbench. If
you compare the oldest OS against another manufacturers newest it
can't really be called a comparison. Compare new workbench to new
Atari OS's and you might think twice before making dumb comments. Too
bad I beleive you're way too narrowminded to do a fair comparison, but
then again I'm probably that too ;)

>pretty case. Apple ran out of ideas for selling the same old same-old... :-)
>The problem with cults is, the insane leader manages to take his desciples and
>lead them into mass-suicide.

The iMac has a pretty new architecture. The fanatics are to be found
amongst any computer's users. The amiga hasn't had as many ideas that
hit even the prototype level ... Atari did ... say no more

>> The other computer is obsolete and will be known for its significants as
>> being the last nail in the coffin of Apple computing.
>> Too different, too little, too late.
>
>The sooner Apple goes, the better. They're damn lucky they made it this far.
>Never before, Microsoft aside, have I ever seen sucha truly visionless
>company.

Many things can be said about Apple, and being visionless isn't one.
The PC market however hasn't come up with much the last 10 years.
Apple will exist as long as it fills a function the PC does not ...
and the MS-PC does have many weak spots. Apple will not fall in the
comming years yet.

<weird angle cut>

>> With the Atari, the computer speaks for itself and the egos are left at the
>> keyboard. There is little to brag about because it just does it. Thats it,
>> thats all, its that simple.
>
>Voice synth? I never knew the ST could do that. For 1985 the Amiga could...
>your entire post sounds like a brag, what the hell are you implying by your
>comment that there's little to brag about? Unless the ST is such a little
>pointless piece of paltry silicon, of course.

You remember the voice in the "Das Boot" music? Or perhaps the
classical metallic voice saying "Techno" in a lot of old techno music?
Guess what musicians used? They used the Atari text-to-speech
programme.

The amiga was and still is like any old "forgotten" platform, just
like the atari. Both have it's supporters and both camps are about
equally fanatical. Some companies brings life to the old names by
designing new hardware that supports some of the old software ...
doesn't differ much.
I think the real difference was that most of the amiga users
were the average "elite d00d" into piracy, playing games and not much
else. The Atari users where involved and creative.
Besides that the amiga is plain uggly!

I have an Atari 400 System and Software for Auction on eBay. Bidding starts
at $9.00. Below is a description of the items for sale. You can view the
auction at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=85521809

Here's a copy of the item list:

Hardware:
Atari 400 - 16 K RAM (appears to work fine... I've plugged in a few
carts and come up fine)
(it's missing one of screws in the case).
Atari 410 - Datasette Recorder (works fine recording and reading new
programs,
but has problems reading some old tapes)
Atari 400/800 power supply (fuse has been bypassed, required taping case,
works great)
Manual Switch box (spade plug replaced with wire... works fine)
XM301 Modem (300 baud, direct connect modem... guess this one's more for
nostalgia)
(I have not personally tested the modem, it's condition is
unknown)

Cartridges:
BASIC
Joust
Star Raiders

Tapes: (the programs appear to be intact, but I they have problems with the
410
included... I think it has to do with the age of the 410 and
not the tapes themselves)
Frogger
Quantitative Comparisons
Darts (Thorn EMI)
Thorn EMI Computer 4
Hockey (Gamma Software)
Sound Editor
European Scene Jogsaw Puzzles Vol. 1
Blackjack (Atari)
SCRAM (Atari) (nuclear power plant simulation)
Sargon II
Drawpix (Artworx)
Nukewar

Manuals:
Compute's First Book of Atari
Atari 400 Basic Reference Manual
Atari 410 Program Recorder Operator's Manual
Atari 400 Owner's Guide
Atari BASIC
Atari for Kids from 8 to 80

(game/software manuals)
Sargon II
Darts
Soccer
River Rescue
Crypts of Terror
Radius
Blackjack
Drawpic
Sound Editor
Instedit
SCRAM (nuclear power plant simulator)
Nukewar

->less memory and did a hell of a lot more. The ST is made of generic rubbish
->chips whereas the Amiga was specially designed to do all sorts of wonderful
->things. And both had cost around the same price.

I'm curious about some of these statements. I bought a 520ST in 1985 for
$399.00. The Amiga A1000 couldn't be touched for that.

What makes you think the Amiga used less memory? The A1000 was divided into
2 256k sections, one of them Chip Ram, which is used for sounds, pics, etc.
In other words, you couldn't load a 300k picture into an A1000 in 1985.

->Uh-huh. Last I heard, you couldn't get a new Atari ST since 1994 (were all
->ST-type computers discontinued in 1993, as I had heard?) You must opt for a
->used model, which means its lifespan is somewhat limited.

The 520ST through the Mega STe are all out of production now. The Falcon
and TT are no longer produced but clones are being made that fit the bill
quite nicely, thank you.

->> While other less educated users have paraded through a long line of newer
->> computers trying to keep up to date the ST remains a Stable element to all
->> Atari users.
->
->Right... if any computer could *really* be compared to today's computers, the
->Amiga is the only one. It pre-emptively multitasks. Screw that, it does
->multitask. The Amiga has 4 independent CPUs whereas PeeCees, Crapintoshes and
->STd's have but one. The only OSes which could compare to the Amiga are OS/2
->(which is a bloated waste of time) and BeOS (which deserves to be the future,
->not bloatware NT which is sluggish by far in comparison). With the native ECS
->or AGA chipsets, the amount of things you could do with video and the workbench
->desktop are staggering. The ST up to date, stop making me laugh! The ST audio
->is shite, too. And Amiga's 8-bit audio is still viable. Amiga's FM synth is
->equal to PeeCee's MIDI. Since PC FM synth is still shite and will always be
->shite,Uncreative Labs (the 'standard') decided to have everybody rely on
->big-ass bloated .WAV files - almost as bad as raw sound sample data in terms of
->size. When PeeCee users say the sound is better than the Amiga, they don't
->take this small reality into account. PeeCee rules because of a damn
->recording, not real effort on the part of hardware. The SB Live product is
->finally duplicating some Amiga audio features like the ability to play several
->sounds simaultaneously from multiple programs (took 14 bloody years, though!)

We didn't have multitasking at first, I'll gladly admit (unless you count
the limited multitasking that DA's do), but we do have several flavors of

multitasking now. Geneva co-operatively multitasks, and MagiC as well as
MiNT pre-emptively multitask.

I was a bit disappointed in the the stock ST's sound. However the STe was
much closer to the Amiga, and (face it!), the Falcon's audio blows the
Amiga away...

->Liar liar, wiener on fire. Go study up on the Amiga.

Don't have to, I've owned an A1000, A2000, and A1200. I've still got the
A1000, simply because I value Jay Miners signature. Jay was also very
instrumental with the Atari 8-Bit line as well. ;-)

->Bollocks! The Amiga 1000 was half the price of your comparable 80286 IBM PC.
->where the hell are you getting your figures: Drunk-Accountants-r-us? The
->fucking thing may have cost more than the Atari ShiT, but the Amiga had
->multiple processors which were specially designed. The ST, like Mac and IBM,
->were made with generic hardware.

Yes, but the original poster was talking about compared to the 520ST. Oh, I
see you do concede the price (finally). Don't forget that the Atari ST line
could do MIDI, standard, and you still can't on an Amiga (out of the box).

->hahahahahahahahahaha! TOS is Jackie Tramiels' crap version of DOS. And GEM
->came from a different company. Atari was so lame they couldn't write their own
->OS! IBM was just as bad! And the ST does not pre-emptively multitask. Like
->the Mac, Win 3.x/95/98, and so on, the ST co-operatively multitasks. In other
->words, it doesn't multitask. What the hell is this Magic rubbish anyway? A
->replacement OS for the ST which won't run current ST software?

You can effectively pre-emptive multitask with just about any Atari today.

MagiC is a complete OS replacement for Atari computers that does do
pre-emptive multitasking. In full. Its very compatible. Guess what I'm
running on my Falcon? MiNT. Its a Unix clone (mixture of Linux, netBSD,
and S4R4), so yes - it does pre-emptive multitasking too... ;-)

->STOP THE BLOODY YELLING YOU TWIT! Proof, please, on how the ST surfed the
->web. The web was still classified by the military. And more Amigas got into
->top-secret US installations than STs. Yeah yeah, the ST of 1985 had color. So
->did the Amiga. So did the PC, for whatever that was worth. Big frigging
->deal. God, stop being an imbecile! "Other computers from this era CAN'T DO IT
->PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise,
->the Amiga of the time did 4096 colors at once! Your ST couldn't get ANYWHERE
->NEAR THAT! I may be slightly ignorant on the ST, but you are way off your
->rocker in terms of comparing the Amiga to the ST...

I view 4096 color Targas on my stock Mega ST, and you can view 19,000+ color
pics on an STe...

'Nuff said... ;-)

Hi K.Hampf! I agree with what you say, just thought I'd throw something
else in here to show Mr. "infinity rising" that we are familiar with the
other platforms.

The early Amiga's 4096 color mode was known as HAM (hold and modify).
It suffered from being slow (taking almost all CPU time), and also
had "fringing". It is a hardware feature, and very nearly didn't make
it into the Amiga design. Some creative users added interlaced HAM,
which came to be known as "Sliced HAM". AGA models added super HAM,
with increased colors, but still suffers from fringing.

The Amiga also has an "extra half-brite" mode, where the intensities
of the original 32 colors are changed so that you get 64 colors. Some
games put this effect to good use. "Black Crypt" springs to mind.

Catch ya later... ;-)

Yes, but fun. Clearly most of this is the result of the frequent Mac poster in this NG. I don't think anyone cares in advocacy. Its just fun. Alot more fun then nothing happening month after month. It isn't comp.sys.atari.st where we take things more seriously. Besides I can see you have bigger problems. On 30 Mar 1999 02:13:59 , "Edward Williams" wrote: >Who Cares..... >You might Like Atari,MAC or PC >but who really cares when the job to be done with a computer is more than >just window dressing.... >I like All Computers some more than others but I DON'T FIGHT over which is >best >The Atari is a dead platform as is the Amiga and others >but if it makes ya happy then use it > > >------------------ > >Edward Williams >Tchermok@flash.net

LOOK AT THIS LIST!!!

>68 8-Bit Atari Computers
>(5x800,3x400,6x600XL(64K),12x600XL(256K),3x600XL(512K),14x800XL(256K),15x120
>0XL(512K),5x130XE,2x130XE(1088K),3xXEGS(128K)

I have none of the above.

>21 Atari ST Computers
>5x520ST,7x1040ST,3x1040STe,2xMega ST,2xMega STe,1xTT,1xFalcon

5x520ST, 1x1040ST, 1x1040STe, 1xMega 2, 1xTT, 1xFalcon (of course I just purchased all of these in the last year barring 1 520ST which has been with me since 1985.

13x PC Clones XT-PII-450

Man you must have a STORE. I have had as many as 20 various PCs but unloaded them all.

>27x Macs Mac128-iMAC

Yup, you have the computer bug real bad.

>Amiga 1000x2,Amiga 500x3,Amiga 2000x2,Amiga 2500x1

Had a 1000, 500, and what I consider the first decent Amiga, the A3000. Then I had a few 4000 and videotoaster.

>1 Kaypro 10,1 Zenith Z-100,2 Olivetti L1 M20's,50+ TS/1000

Clearly you are a museum:-).

>Close to 87,000 Floppies
>900 CD's
>And Thats just in the house

And just think, there must not be room for the C64:-).

Well, I am neither for or against computer wars. Computers are different. This is advocacy where one should be expounding the virtues and features of the computers they use.

As posting merely stating the STs capabilities can offend readers.

Regardless, I believe you have a hard enough time just trying to remember how each OS works.

I can just see cpm and wordstar being no problem to remember at all:-).

Later Brian.

If you are after anything Atari wise, then let me know;) I don't mind posting things to the USA, I've done it a few times.

If you want a list, although I've not got around to updating it yet;), drop me a line and I'll send it via email.

I also have a web site, and yes you are correct as this hasn't been updated in a month. There is only a certain amount a single person can do in a day, and when I have to deal with side effects of my medication it doesn't help.

I have the following for items for sale. The only rule is that the Jag, Jag CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

Cartridge Games:
Alien vs. Predator Cybermorph Fight for Life
Iron Soldier Kasumi Ninja Raiden
Rayman Theme Park Zool2
Trevor McFur in the Crescent Galaxy
Val d'Isere Skiing & Snowboarding

CD Games:
Blue Lightning Myst Vid Grid
BTW, I am not leaving the Atari scene.

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

NO, You can't get them in your local CompUSA.
They sell these in the same stores where you buy the 12000 new developed 3th party products and 1600 new software titles specially developed for the iMAC, didn't You notice ?

Cheers from Belgium

Dennis

Yeah, well maybe so in the States, but here in Europe the situation is
different. In the last Atari Computing, published here in the UK there are
14 adverts from companies big and small, and those are just in the UK.
Virtually every country in Western Europe (and some in the East) you could
name has companies that primarily exist to serve the Atari platform.

Try it - name a country and I'll tell you what is there. And the web is
still live and active, just do a search and you'll see. Try ASH's website
for example. They are still producing quality software, including the
MagiC pre-emptive multitasking system (for ALL Ataris, not just the power
machines) and CAB, currently up to version 2.7 in English, is a web
browser thats just been released for the iMac.

Well I can't help that you Americans do not know ENGLISH when you see it.
Those messages still DO NOT MENTION Atari, nor attack them. There's no
context in them that relates to Ataris.

Cheers!

What I meant to say was that you just gave a positive spin to the reality, which is that old Ataris are not good Internet machines for the majority of people.
The fact that you're happy with what your 15 year old machine can do on the internet is nothing outstanding. People will settle for next to nothing these days. I mean, if you don't expect much, whatever your old equipment provides will be plenty for you, and this surely seems to be your case here.
Now, what I found laughable is the fact that you try to apply YOUR reality to the world at large. Most people won't put up with bad performance, tricky installations, etc. You've got to wake up and realize the computing world has changed, and it's been a while since that happened.
It would've been far more interesting if you had written a report about your ST and how you can get by with it on the internet, but all you did was deny the fact that there are cheap machines these days that can do the same job, only far better.

>I can only think of two possible answers to your rude reply.
>

Was it rude? If you thought so, I'm sorry, but it was purely in the advocacy spirit :)

>1) You are an ignorant (lacking in knowledge) user of more powerful Atari
>equipment and you have failed to include the ST in your thought process.
>

Well, I do have a "more powerful" Atari than you do, but barelyt :) I
got a 1040STe... I know fully what it can do, and what it can't.

>2) You are a user of another platform and quite frankly are clueless.
>Normally these people own IBM PCs and MS products, however these users
>usually know nothing of Ataris nor can they be bothered trying to find out
>anything about them let alone waste valuable bandwith replying. Therefore

>users have bigger problems of their own than to worry about Atari, and the
>Amiga Atari wars, while Great as they were are now part of OS history.
>Therefore you are a Mac user with limited knowledge.
>

Wow, almost there, Sherlock :) But I guess that checking the headers
gave you a better hint :P
Anyway, I am a Mac user indeed, got 3 of'em, and I do have some sort
of knowleadge about Ataris, and assorted platforms (Amiga including).

>Luckily for me I have been winning bets and now I am on my second year of
>FREE INTERNET ACCESS for merely hooking up and using my ST on the internet.
>No big deal.
>

What bets?
Just because YOU can get on the internet doesn't mean what you see
and use is what most people would. I wouldn't settle for a 16 colour,
lo-res screen. You do. See?
Mind you, I can get my Commodore on the internet, with a shell
account and a 2400bps modem. Will I win any bets? Of course. No one
would think an old 8 bit computer can connect on the internet. But is
doing so practical, and USEFUL for me, or the majority of people? I
don't think so...

>Since you are rude , while I am only trying to have some fun in
>comp.sys.atari.advocacy I think you have received more of an answer then
>you deserve.
>

I am not rude. I was just truly gobsmacked at your post. I couldn't
believe how far detached from reality some people can be these days.

>I am no fool.
>

You might not be a fool, but by posting things like that, you surely
make yourself look like one.

Wake up, man. It's the nineties, almost 2000. The same people that
bought the stupid 286/386s are now using a machine that's probably 100
times faster than yours, and costs the same as your ST did. And you?
You're stuck in the past.
And the folks who bought Macs with small b/w screens are now enjoying
their $800 iMacs, with big and bright 15"s...

>quality of output reflects thus...

Humm... My Mac is damn fast at rendering Bryce scenes, and if it's
"cheating", I honestly can't notice. What I CAN notice though is that
the quality of the render, at 1024x768, is better than anything that POV
ray (the only 3D renderer for Ataris?) will ever do.

> Ask GateWay...The question is can you buy a TOS PPC laptop today ?

Well Kinda. Many people buy PowerBooks, such as yours, and run
MagiCMac on it. MagiCMac lets people run MagiC, a preemptive
mtasking, fully modern, TOS compatable environment. I use it on
my iMac because it blows MacOS away. Im not going to argue with
you about it though, there is a demo available which you can
download and try for yourself. Make sure to get the replacement
desktop Jinnee 2.01 demo too. If you want an english Desktop, get
Thing 1.27.
The newer versions of Jinnee now let you launch Mac applications
from the jinnee desktop, so I have MagiCMac boot up
automatically, and when I want to use a Mac app, I still dont
have to use slow finder..
You can find links for all of this on my page.
After using Jinnee, I dont know how you could go back to finder.
PS; are there any replacement desktops for the Mac? Ive heard of
some but am not able to find any.?

Amiga's already have 060/PPC and soon will have G3/G4. Both can be used
simultaneously from what I understand, so dual processing is available on
Amiga's if what I understand is correct.

And guess what,

A flicker fixer, or better still a graphics card fixes that. Maybe I'll get
that Voodoo addon that is in production as of now...

I would have to say the much more up-to-date
> OS's of the Atari looks, ah let's say - a bit better.

Really?. And have you seen Workbench lately?. Looks like the Atari OS's
have only just caught up.
And with Amiga there are no arguements over which OS is better for the
Amiga, unlike some of the BS i've seen in c.s.a.st.

A hardware hack?. How was the Amiga less of an industrial design then say a
Mac or ST?. And I might add, the Amiga didn't have a 40% failure rate out
of the box, unlike early ST's.
Not to mention the fact that the ST was virtually unexpandable, and had all
it's chips (except ROMs) soldered in. That reeks of cheap and nasty.

What, a hacked CP/M/GUI/68K/DOS kludge is better then an OS specifically
written to work 100% with the hardware?. Get real.

64 on EHB modes, but that mode wasn't available on the A1000 - at least not
the first ones.

Through the YM soundchip... bwahahaha. The Amiga text-to-speech is widely
regarded as one of the best implementation for a home computer, still.
Better check your Das Boot sources too.

The Amiga is far better supported, with more addons then you can poke a
stick at.

> I think the real difference was that most of the amiga users
> were the average "elite d00d" into piracy, playing games and not much
> else. The Atari users where involved and creative.

Now that is just plain BS. Amigas are still being used for professional
quality video, art and sound production, as they have always been used for.
Most Atari's where used for games also, and in any case, the creative use
of Amigas is well documented.

> Besides that the amiga is plain uggly!

Which one ?. But all those expansion slots Atari users don't have make up
for any "uglyness" you may perceive..

Just for the record, there is more than 1 3D renderer for TOS computers. I
can think of Xenomorph right away, and I'm sure there are more... ;-)

Right. Just like many of us are looking at the new Eclipse board that will
support PCI graphic cards. Specifically the ATI Rage II with 4 megs of VRAM.

->And with Amiga there are no arguements over which OS is better for the
->Amiga, unlike some of the BS i've seen in c.s.a.st.

Thats not the whole truth and you know it. There has been some very
bitter arguments in the Amiga newsgroups over New Icons, Magic WB,
and half a dozen other WB enhancements...

Comedy, perhaps. I enjoyed reading your posts. You have alot to say about the Amiga considering I only briefly mentioned the A1000. I am comparing only computers of 1985. My 520ST has been with me the entire time. The A1000 is one of my favourite computers. In many ways it is a statement in computing. However it does not do a hell of alot more with 256K. My A500 I purchased in 1987 with 1meg and a second DS drive kickstart 1.2 and workbench 1.3 was better than the A1000 yet a compromise. Unfortuneately after switching to it, I found it lacking in too many areas short of playing games. Many people switched to Amiga with the coming of the A500. I sold mine, got the memory upgrade, another 520ST and a Laserprinter.

The A2000 is a different story altogether especially once the toaster actually came out. However when I got my A3000 around 1990, I was much happier as it finally seemed complete and I followed this up with 2 A4000s. Lightwave, Imagine and Calligary finally replaced the modelling of Cybersculpt and its heiarchial object structure. I could go on, but I won't and people will be thankful:-). But in essence, I had roughly $80000 tied up in Amiga computers, Laserdisc recorders and numerous video cards, by 1991-2. The Falcon was demonstrated to me by Atari before its release and I decided that it wasn't worth taking the chance on regardless of how impressive it appeared. Therefore by 1992, I had pretty much abandoned the Atari Platform, short of using the 520ST for Calamus.

Amigas are long gone, (actually they were stolen TWICE) losing valuable data, (Stole the backups too:-(.) and now all animation is done on far more powerful PCs.

In the meantime after a 7 year absence with Atari, I discovered that this 520ST is quite clearly still supported. I installed STing and had my PPP/PAP connection. This was the only kind supported by our provider. I was shocked to discover there was still alot of activity in the Atari newsgroup. I thought Atari was long gone. But the users aren't. I was absolutely suprised to see all this software running on my ST which never even had the OS upgraded. Hell, I was suprised to see new software let alone any past 1992.

So in a nutshell, this basic little machine is working well beyond my expectations for it. The A1000 (although I am very close to getting one just to have gather dust:-) has a few to many limitations, but does have a cult status in a way. Although I don't believe you own one. In 1985 these

machines were very expensive.

>Uh-huh. Last I heard, you
couldn't get a new Atari ST since 1994 (were all ST-type computers
discontinued in 1993, as I had heard?

I am speaking of purchases in 1985. Today you can buy an ST for $5.
I picked up a MegaST for $20Cdn. It is simply very cheap to have alot of
fun, with a good group of people.

) You must opt for a used model,
which means its lifespan is somewhat limited. >

This 520ST is 14years old? How limited is that? All computers lifespans are
limited. The software that I can purchase today runs on my 14 year old
machine. The shareware and pd programs written in 1998-9 run on it. And if
these programs were crap, I wouldn't even bother turning on the 520ST.
Plus I like the interaction with the software authors.

>Right... if any computer could *really*
be compared to today's computers,

The comparision is more to what todays computer uses are for. The ST and
Amiga because of their graphical abilities have been able to handle
animations and pagelayout. This leads to their ability to adapt to the
current status of the WWW easier. The times have changed and a computers
ability to adapt to the change determines its obsolescence.

the >Amiga is the only one. It
pre-emptively multitasks. Screw that, it does multitask. The Amiga has 4
independent CPUs

Clarify this?

whereas PeeCees, Crapintoshes and >STd's have but one.

Yes.

>With the native ECS
>or AGA chipsets, the amount of things you could do with video and the
workbench >desktop are staggering. The ST up to date, stop making me
laugh! The ST audio >is shite, too.

AGA in A1000? ECS in A1000, Workbench is excellent. But again, this thread
isn't intended by me to cover current hardware mods and OS updates that
don't work in the A1000. The A1000 can be in a 1985 state. Like my 520ST.
Therefore to handle the graphical load you need to upgrade the A1000 memory
like the 520ST. Similar state to compare by. Any other hardware mods that
work are a bonus for perhaps another thread that I may start:-).

The Thread is 520ST TOS 1.0 Rules.

And Amiga's 8-bit audio is still
<snip>
viable. (took 14 bloody years, though!)

Clearly no
other computer from 1985 has survived the test. When purchasing >> a
computer that won't be obsolete, the ST has proven that the life span of >>
a computer is not 2 years, but that it is 15 years and more.

<snip> child like taunting eliminated.

>Go study up on the Amiga.

Boy you got me;-). Turn on the TV. If you are really, really really really,
lucky, you may catch a documentary with some excellent animations on the
history channel created with the Amiga in 1993-5. However, these were done
without the help of the A1000 which existed roughly 10years prior. A number
of objects were still created with cyber sculpt on the 520ST listed above
as well as a Mega4. Regardless I am long removed from Industrial video. It
was fun from 1985 to 1995. Btw, I do have a large collection of animations
on video tape created on the ST from 1985 to 1990 that are excellent in
concept yet clearly lacking in both resolution and colour by todays
standards. The ST didnot slow down when the animation got complex. Even
the A3000 running the same animation slowed down as more objects appeared
on the screen. It no longer became a factor as we went from realtime
animations to single frame recording. But yeah, I have forgotten alot. I
tried to get away from computers (and was totally successful) for 3 years.
Fell off the wagon again. Regardless, there are a number of commercials
that we did the animations for that are seen on Canadian television and
there is no ST involvement, if that makes you feel better. Perhaps you
might study up on the ST if you are posting in an ST NG. I do need to study
up, but only to remember what I have forgotten. I still have all my Amiga
software manuals, at least they weren't stolen.

> Where are the expensive
Macs of yesterday, today? While once considered the >> leading edge,
clearly all Expensive macs have proven that you have merely >> flushed your
money down the toilet. >

>For once, I agree.

For once? You have only replied to a 4 line comment I made on the A1000.
And have an opinion on the ST. But I am happy you agree nonetheless.

>> IBMPC compatibles of the same era are long gone into the bit bucket. Not
>> capable of anything then, today they merely show up in the technological
>> waste bin. >

>I totally agree.

hmm, you agree with me on mac, and on ibm, but not with the A1000. You seem
to trust my statements on the other platforms. What if I was just as
inacurate with their platforms. I can truly state I have had a tonne of
more use out of the Amigas and the Ataris.

>Amiga? Strange but true the 1000
Amiga was both expensive and rough around the edges. Long an Atari
adversary, the amiga was a failure in its early incarnation and early

users paid a hefty price for that 256 k machine. >

>Bollocks! The Amiga
1000 was half the price of your comparable 80286 IBM PC. >where the hell
are you getting your figures: Drunk-Accountants-r-us? The >fucking thing
may have cost more than the Atari ShiT,

I don't have any figures or they would have been posted. However you have supported the statement that the Amiga was more expensive than the Atari. Regardless I still have the invoices for my A500 and My 520ST. And the A500 was alot cheaper than the A1000.

but the Amiga had >multiple
processors which were specially designed.

There you go again. I think you mean to say something else. However we know the Amigas hardware technology was excellent.

> The ST, like Mac and IBM, were made with generic hardware.

Actually that is pretty close to the truth. The ST is pretty much off the shelf parts. The whole package works very well together.

>> How could one ever complain of a computer where you can get NEW
software 15 years after it release. This software allows for all the
modern uses that >> they current platforms demand.

<snip> mild sarcasm,

? The Amiga is in the same boat as the ST in this
regard.

Good then. Since I don't have an A1000 and was thinking of getting one very shortly, I will be happy to know that the current Amiga software and internet packages will work with it. Please email me a minimum spec required for the A1000. I have heard there are a couple of good packages. Which one do you use?

My god, people still write games for the Atari 2600! >

Yes, clearly happy, sick individuals. However I can't seem to use Pong over the internet with it:-).

>> >>
Clearly computers 2 years old are having difficulty running the latest >>
software for their OS, resulting in forced obsolescence of computers with
>> superior hardware and processing power to the ST. >

>Uh-huh. And I
have three testicles. Want one? Remember, society is built on >the
acquisition of money.

Well, I want to keep my money and not always buy the latest hardware just to keep up with MS. After 15 years of computing I am more interested in older machines that can operate satisfactorily in todays environment.

By the way, that third testicle could make you a film star.

This is why people are engineering this stuff so
>people upgrade.

really?

> >hahahahahahahahahaha!
! And the ST does not pre-emptively multitask.

Well thanks for informing me of this. Perhaps you need to study up on the ST if you are going to post here. Both Magic and Mint are premptive as is N.aes and Multi-TOS. All of which will work on the 1985 ST. And if you don't understand, they run the Atari Software. Not like Linux or OS9 etc. But yes, this is found on the Amigas of 1985 but not the DOS/ibm and Macs of yesteryear.

> Like the Mac, Win
3.x/95/98, and so on, the ST co-operatively multitasks. In other >words, it doesn't multitask.

Actually Geneva is co-operative and works pretty good.

What the hell is this Magic rubbish anyway? A
>replacement OS for the ST which won't run current ST software? >

Close, premptive multi tasking OS that DOES run ST software. Especially current ST software which takes full advantage of its newer features. We won't even discuss MINT.

>STOP THE BLOODY YELLING YOU TWIT!

Well, you have agreed with this "Twit" on more than one occasion.

. And more Amigas got
into top-secret US installations than STs.

Yes, Clifford SToll must have been after German Amiga users. If this is something to be proud of. I better read his book again. My memory seems to remember something about ST. I didn't know that using a computer to get into military installations was a top priority for a user today. Security is also alot tighter than 10 years ago.

Yeah yeah, the ST of 1985 had
color. So >did the Amiga. So did the PC, for whatever that was worth.
Big frigging >deal.

The mac didn't:-). Sorry its part of the argument. Yes CGA colour was awesome and is excellent to use for a web browser today. Just because the A1000 has a feature the others don't doesn't make the argument for the Atari any weaker.

God, stop being an imbecile! "Other computers from
this era CAN'T DO IT >PERIOD" is a load of rubbish. The Amiga certainly had 16 colors.

Yes it did, and you are going to give me the information on the Web browser that I can use for it. Hopefully with more than 16 colours.

Jeez louise, >the Amiga of the time did 4096 colors at
once! Your ST couldn't get ANYWHERE >NEAR THAT!

I believe I can get very close to that. Especially today. However if you had ask me that 10 years ago, I would have stopped at 512Real and 3500 simulated. But really I can surpass that. And with my STe stomp it. However If the web browser operates in 4096 colours on the A1000 I will be really blown away.

> I may be slightly
ignorant on the ST, but you are way off your >rocker in terms of comparing the Amiga to the ST...

No I am not. I am comparing a 520ST to the A1000. Where I am lacking in knowledge is any developments after 1995. You are not slightly ignorant, but simply ignorant. It is not an insult, you only know what you have heard.

>Go get a date. You need one worse than I do. > >> >>

What did I do to deserve that? Thankfully I am back to computers and motorcycle racing which are the things I truly enjoy and am no longer in need of a clingon nagging everything I do until I stop doing it. Its good to be back.

>>Today a 520ST is the CHEAPEST internet
>>computer available..

>It's cheap. it's a useless pile of shit.

> >> >> And it gets better. The ST is the
lowest common denominator. It can do it >> all. It does all functions with very respectable speed. The ST is the >> sportscar of computing.

>The ST's interface is the most backwards I've
>ever used.

I have never heard that before, even from my many former Amiga using friends who realized just how friendly the STs operating system was. There is nothing backwards about it. I really think you are just yacking off the top of your head. There are alot of things you could pick out in the ST TOS 1.0/GEM that were very unrefined. But the ST interface is anything but backward. Perhaps you never used the Amigas when something as simple as a file selector was a luxury. Regardless this would have had little effect on how I view an A1000. Which seems to be more of a concern for you than actually what the ST is capable of.

> Even the Mac was easier to use.

Well you are into another platform and actually made an accurate statement if one is comparing the early Atari GEM to something like System 6. I used a Mac emulator on and off for a few years and it was definitely easy to use

and more complete than Digital Researchs GUI.

<SNIP> Long posting cut, nothing of value found simply insults.

. Things simply to off topic to reply to.

While supporting the strengths of the Amiga platform, which was/is an excellent piece of architecture, there is really no evidence provided that I can use the A1000 for the same functions that I am currently using the 520ST for or that the new Amiga software programs will work with it.

Later Brian.

>responses.

You are correct. Although the intent of the posting was to provide three distinct functions.

1) Give James Haslam something Atari to read about, since he is tired of Sinclaps Mac Postings. (Is this Atari oriented enough for you:-).

2) Since James uses a Falcon (which I also recently purchased), I thought I would post my uses with the 520ST that I purchased 15 years ago. Since I set it up on the internet in 1997 on a bet that it couldn't do PPP/PAP and that its web browser CAB didn't work, it just happened to turn out that it worked so well for me that I haven't had a need to change it. It was a pleasant surprise. And since my brother in law runs an internet providing service he was totally impressed with the ability of the 8mhz machine. Unfortuneately he doesn't live close enough to me to use his IP Service. There are alot of ST users who read the posts in comp.sys.atari.st however much of the focus is on Mint/Magic/Hades/Milan/Falcons and TTs and the ST is often overlooked. However we are all their using our STs just the same. While one of the benefits with CAB is its ability to Censor the ADs, Falcon/TT and other users may not see the advantage gained of this feature. Alot of Ads are stupid Gif Animations that take longer on a STock ST to process. They don't add anything to the web page and the Censor feature which pulls up a Gif Pic is a better solution than turning the graphics off. This feature has impressed my non Atari using friends and they would love to see this. However things like this make using an ST all the more easier on the internet.

3)Draw Sinclap out of his Mac shell for a moment and actually read something about Ataris rather than preach to us about Apple computers and IMACs. Since this has been successful, finding anyone else is even reading comp.sys.atari.advocacy is just a bonus.

> >--- original post with my reality-oriented comments. >
>Brian Van TIlborg wrote: > >> Hmm, nope, everything is correct as posted.
>

> >> Perhaps you could tell me what >> part confuses you. It is posted with a post marketing enthusiasm that is >> simply meant to catch ones attention. >

>It is not enthusiasm when you run around blindly criticising
other computer brand without having a proper knowledge of them. If you do know the competing brands and lie or not specify certain information, it makes you look like a real gastropod (slug).

I have yet to see A 286/macplus or A1000 do a better job. Both the Mac and the A1000 are capable as the ST is. However If the software isn't there, then there is little wrong with the comparision. Ironically ICAB has come out for the Mac. While I think it offers little for the PowerMac users there apparantly will be a 68*00 version to follow.

>You were mostly right about the Mac, tho.

Yup, and wrong about the Amiga, I understand fully now.

>The facts are the facts. Well, you've omitted or lied on a couple of
>them - hopefully out of ignorance and not out of sheer deception. I don't
>like deception, you see...

I read your previous post. You uncovered no deception. All of your counter arguments regarding the ST were incorrect. All your Amiga arguments cover a broad time period. And you fully agree with both my Mac and Ibm comments. So clearly you believe that I am simply lying about the Amiga. I think not. I also think many mac users will claim I am lying about the ST and wrong about the mac as well. I have no need to claim deception for a computer that can be had for under $20 today.

> > >> I would be suprised if you used an ST

>So bloody what? Many people use Amiga 500s on the
>'net, too - and they can more accurately draw the pics than your ST
>because of greater color depths. And that's a fact. > >Define
>outrageous!

Amiga 500= 1987. That is two years after the 520ST. They are not part of the equation. They are not using kickstart 1.2 and workbench 1.2 either I am sure. And if they are thats ok. The 520ST is doing it with that very first really crappy TOS that you so humbly described.

> I can only think of two possible answers to your rude
>reply. Well, when you make a rude post, do you expect candy and roses?!

I think you are most offended. And there simply wasn't anything in the post against amiga. No one is coming to defend the DOS based ATs. His comments are based on the use of my Atari ST not other older computers.

>Takes one to know one and you've definitely shown ignorance,
>unless you lied and I've said I don't like people who attempt to deceive
>in order to improve their own status..

What on earth are your talking about?

,
> >Well, I currently have a PeeCee clone and BeOS, WinNT 4,
>Linux (which I don't >use since it's crap), and OS/2 4. I also have an
>Amiga 500 and 3000.

Linux is crap? Hey, I don't know anything about that, but I hope you don't get something else going with that one. Since you own both an A500 and an A3000 which were the first two Amigas that I owned you should know exactly what I am talking about. The 3000 is the first working Amiga. I certainly prefer it stock to my TT. However the software makes all the difference at this stage. And it is here that the two computers really diverge.

>I nearly
>bought an Atari ST -- and then I saw the Amiga... bloody glad I didn't
>buy the ST.

Gee, I bought an A500. Bloody wish I hadn't. Luckily there were a tonne of pimply faced kids that wanted it.

> , Therefore you are most likely
>a NON INTEL user. You'd better be right in your guesses!

You and I know I am right. So does he as its in his header:-). There is no guessing. Just a chance he might be using MAGIC with his MAC.

>You're
>definitely wrong about me since you think that just because I own and use
>a PC with Windows NT on it that I'm totally ignorant of everything else
>that time has presented.

How, could I be wrong. THis is my first reply to you. I am writing both reply postings to your messages at the same time. You may use a PC but you are an Amiga user. What a surprise. So am I:-).

Therefore you are a Mac user with limited knowledge. >

>Possible. You did
>make the biggest attacks on the Mac. And I must admit, I'm not fond of
>the Mac...

I actually like all computers. I would like to run MagicMac as well.
If you knew just how much more powerful the PCs are for Animations its truly hard to fathom how advanced they have become. You can pretty much ignore the OS and just use the brute horsepower and all the updated Amiga programs that have been ported and updated.

>You'll get a lot more rude posts. Not by me. I've had all I need to say
>regarding this, unless you make a really good response to all this!

Yes, you said enough to the point where you had nothing to say and kept saying nothing. However, perhaps you misunderstood the posting and a second read will help.

No need to reply.

Later Brian.

Yup, I've had A500, A3000, and a couple A4000. Regardless Ron, what would I need to get an A1000 on the internet with a Graphical Web browser, Similar or Superior to CAB as I know some of them are. All my Amigas were stolen long before we had internet access. (They never took the ST, which makes it even more better:-).

I have come across one and would like all my computers internet friendly. Then if I could run masquerading through my TT, I could have alot of fun.

Invest? Since when is a computer ever an investment? At best you can use it for work and write it off, (not always). It depreciates rapidly and therefore as with any tool it must have some productive benefit that either saves or makes money. On the other side the computer is just a toy. The end result is not an investment but rather sunk costs. The cost of an ST today is roughly $20. to $50. Hardly what one would term and investment. And simply a sunk cost that most anyone can afford. The benefits are a social comunity that even tolerates the likes of you:-).

But if one is considering the computer as an investment, well mine works just fine after 15 years. And it has adapted to the changes to the internet quite well. In another year or two this may not be the case as more and more Websites become Java oriented. Then a change may be necessary.

But I can say that my next new computer purchase won't be anything that has been promoted in his NG by you.

>
>So why have many upgraded to TT, Falcon Wintel and Mac today? I bet many of
>the Jihads do not use their 520 ST today...Get Real!

Based on the number of ST users lurking, and the fact that I am using mine I would say there is a good proportion of Atari ST users left especially after I saw my email flood with replys from ST users and from those who want to get their STs on the internet and didn't know it was possible.

Based on the number of posts in comp.sys.atari.st of users who have pick up second hand STs and simply need to learn how to use them, it is not long before I am emailed on what is needed to hook an ST up to the internet. The main reason for this is because the 15 year old computer can get on the internet without even the need to upgrade from the first TOS 1.0. Many emails I receive are also from former ST users who left the Atari scene nearly 8-10 years ago. They have now gone through 3 or 4 computers since then, check back to their atari roots and want to come back and see what the new software is like. Then they want to link them to a PC and use IP maquerading and have two computers on the internet. Many have old STs in closets that they pull back out. They find it takes little effort to get a PPP connection with the ST and then some just want to do some hardware hacks to STs to improve their performance. Its just a fun toy.

1) They are using STs because:
A) They bought them new and still use them
B) They bought them Second hand (very cheap) and want to use them
C) They received them via donations and want to use them
D) All current software works on the ST.

2) They are using Falcons/TTs

A) They bought them new and use them
B) Bought them second hand and use them
C) The user base isn't as large for TT/Falcon and there weren't as many machines as the ST, so finding them first is difficult.

Short of the colour there isn't alot of difference in speed on the internet between my Falcon/TT/ST using a 33K modem with STing. There isn't alot of difference against my neighbors P166 either. However, hook up a cablemodem and things change rapidly.

Get real yourself. This is the whole point of the thread.

3) The go to Wintel to play Quake series.

More puzzling is why do we leave and come back?
Even more puzzling is why do you linger around here?

>For once, I agree. The Mac really hasn't

>your case here.

Actually, I expect quite alot from my ST. As a platform the entire Atari/clone set up is inferior to anything on most any platform as an internet computer. I can certainly get more out of my ST on the internet then many users do.

> Now, what I found laughable is the fact that you try to apply YOUR
>reality to the world at large.

No I apply it to comp.sys.atari.advocacy which in my humble opinion is not the hotbed of computing activity. My reality is new atari software run on an old atari st that clearly operates as advertised. Laughable may be the case, but I have laughably been setting up used Megas and STs with freeware

STing/NEWsie/CAB/Frac/TElstar for users who would rather spend $50 or less (Donation) than $1000 for a new computer. If you already own an Atari, what is the big deal about installing freeware and surfing the net. Perhaps there is that game you can't play with everyone. Computer envy has always existed and continues to exist as PC users play "keep up with the Jones", amongst one another. Finding that level of contentment is a fine art, especially as technology moves forward. Envy works both ways. I need not go into details here.

> Most people won't put up with bad
>performance, tricky installations, etc. You've got to wake up and
>realize the computing world has changed, and it's been a while since
>that happened.

Actually I am a returnee to the Atari Scene. My ST pretty sat idle since 1992.

"the computing world has changed, and it's been a while since that happened".

Is that statement meant to be joke?

> It would've been far more interesting if you had written a report
>about your ST and how you can get by with it on the internet, but all
>you did was deny the fact that there are cheap machines these days that
>can do the same job, only far better.

Actually I thought the same. But there isn't much to it. You have the same abilities as a Falcon or TT except without as much colour. You can make your ST faster by modifying the serial port. However mine isn't modified. I compare it with my Falcon/TT/ and my nephews P233. Most differences are in graphics. All features are available in CAB to turn off background image so as to keep a cleaner look. WEB pages look no different then when using a publishing program. NVDI adds the nice outline fonts. Otherwise you go with Gem bitmapped system fonts if you want to save memory. However most of the information for using an ST on the internet is in the FAQs and help is on comp.sys.atari.ST. As I just recently compared the ST to my Falcon and my TT setup on comp.sys.atari.st the same day as I posted here, I see little reason for duplication.

You find me a P150 for $50 or less and I will be happy. There is no insinuation that an ST can what a current computer can do. You know this is true, even from my 1st and 2nd posting to you.

>
>>I can only think of two possible answers to your rude reply.
>>

>>1) You are an ignorant (lacking in knowledge) user of more powerful Atari
>>equipment and you have failed to include the ST in your thought process.
>>
>
> Well, I do have a "more powerful" Atari than you do, but barelyt :) I
>got a 1040STe... I know fully what it can do, and what it can't.

Well, lets not waste time. If you want me to help you get it connected to the internet just for funs sake, I be willing to help. The reality is that if you are using a computer that is superior to the ST for the internet, it is less likely you would use the ST. However, I find when you use an ST and have no other computer for the internet, it delays the inevitable. Time to really have fun and turn it into a hack machine. I have an STe as well. I get a kick out of its photochrome displays of 24bit files. Other than some of my files are as large as 800 k from a 97kjpg, the author of the program was just brilliant.

> Wow, almost there, Sherlock :) But I guess that checking the headers
>gave you a better hint :P

Never overlook the obvious, but never assume either. Perhaps it was just a lucky guess:-).

> Anyway, I am a Mac user indeed, got 3 of'em, and I do have some sort
>of knowleadge about Ataris, and assorted platforms (Amiga including).

To put part of your argument in perspective, the PC domination on the internet is so strong that in many ways the MAC is the inferior product for the internet. Therefore as is done elsewhere, there are articles on getting by on the internet with a Mac. Many internet mags don't even acknowledge the Mac.

> What bets?
> Just because YOU can get on the internet doesn't mean what you see
>and use is what most people would. I wouldn't settle for a 16 colour,
>lo-res screen. You do. See?

Agreed. However it kicks butt of 386s and 486s depending on software. I look at the web page in hi res. If I go beyond the scope of this thread, I had my STe connected to via midi comm and converted the web page pics on the fly via gemview/photochrome thus taking advantage of the STe. However one could use Photochrome in ST mode to stay within the scope of 1985.

> Mind you, I can get my Commodore on the internet, with a shell
>account and a 2400bps modem. Will I win any bets? Of course. No one
>would think an old 8 bit computer can connect on the internet.

I hope you wouldn't win any bets. I used to access the internet long distance with a university terminal account AGES ago. Like everyone did then. However, get your Commodore on with PPP/PAP and you might get something. Infact I believe when I did this thread last year, there was a webpage designer and an offline browser being developed for the C64.

>But is
>doing so practical, and USEFUL for me, or the majority of people? I
>don't think so...

Actually it is pretty practical for alot of people. Using an
Atari/Amiga/Mac combined userbase has never encompassed the majority of
people. What you are saying is that while you have been hanging out in
motorola heaven, you really want the best mostpowerful internet computer
used by the majority of people. Clearly you will settle for less as you
are using a Mac. However when you are ready for a real computer the PIIIs
should really change how things are done.

>
> I am not rude. I was just truly gobsmacked at your post.

I can understand that. I take your word for it.

>I couldn't
>believe how far detached from reality some people can be these days.

Hardly detached from reality. It is all fact. I posted in that manner to
create some sort of reaction. It was very successful. It has created
discussion. The only thing you really can't believe is that the Atari ST
can be used quite well as an internet computer. I have posted the same
information before in a less dramatic fashion.

The bottom line is that if one accepts the TT or Falcon as an acceptable
internet computer, then the ST can also be accepted. If the TT and Falcon
are not considered acceptable (which creates a stir) then neither is the ST
or any Amiga/486 or P150 and under. I happen to list all the above as
minimum requirements for the internet. Just as our IP lists minimum
specs.

If one then accepts the ST as an internet computer, then what other
computer built in 1985 is on the internet with PPP/PAP and a graphical web
browser and doing it with its very first version of its OS?

Now just to throw a wrench into the works, as far as I am aware the Atari
8bit has a Telnet BBs package available and the AtariST doesn'T? Correct me
if I am wrong here. I just caught the end of doctor clu thread in
comp.sys.atari.st.

Finally if you assumed their were comparisions between the ST and current
computers, this is the result of Sinclaps need to associate the Imac
against the ST whenever he needs a moral victory. I think this is just as
foolish as someone believing that my post is intended to compare an ST to a
modern computer.

I do tend to compare certain functions of my ST against my Falcon, TT and
my Nephews Pentium. But none of this was part of the original 520ST TOS 1.0
rules post.

Hope thats clear enough.

Later Brian.

But if this makes you feel better you can see that Bengy has an iMac.
Of course he is running a superior OS on it;-).

And to go full circle this same Magic OS works with the very first ST made.
And it is easily the best upgrade my ST ever got since it received the very
first version of Calamus 1.09n.

Hi Clockmeister

This probably clears up some confusion for multi processors mentioned earlier. However such items will not exist in an A1000. Which is where my thread contained the only mention of Amiga.

>Amiga's already have 060/PPC and soon will have G3/G4. Both can be used
>simultaneously from what I understand, so dual processing is available on
>Amiga's if what I understand is correct.

:-) Touche. Some have Multi Syncs, however.

>
>
>A flicker fixer, or better still a graphics card fixes that. Maybe I'll get
>that Voodoo addon that is in production as of now...

I remember trying this on the A500. Thank heaven for the A3000. Propage brought tears to my eyes at the time, but it wasn't a bad program. One of the first programs with colour separation. I used it to make product cardboard boxes.

<snip desktops/Workbench> Nice touch but I prefer to keep the Amiga/Atari battles back in the early days:-).

>And with Amiga there are no arguements over which OS is better for the
>Amiga, unlike some of the BS i've seen in c.s.a.st.

Well, thats one thing. All STs have TOS. Mint will always be around as its free. Magic will last as long as ASH remains solvent. Both run TOS based software. I also use Geneva. I like all the programs and view them as I do any other piece of software. You view it as BS, I view it as fun reading.

>
>The Yamaha chip was a relic from the 8 bit days. It in no way was
>comparable to the Paula chip.

Sound was brought into the thread by an Amiga user. It in no way reflects the original thread. Other than each Amiga owner will state and restate the

obvious. Just as a Falcon and previous Amiga owner will state the obvious of the superior Falcon Sound. The Amiga was a small (very small) part of the original post. The A1000 simply had some failings. Compare it to the A2000 which is truly a workhorse. Although by todays standards, accelrators and all it is long in tooth.

>
>A hardware hack?. How was the Amiga less of an industrial design then say a

>of the box, unlike early ST's.
>Not to mention the fact that the ST was virtually unexpandable, and had all
>it's chips (except ROMs) soldered in. That reeks of cheap and nasty.

Perhaps hardware hack is meant in the fondest terms of when a hacker was someone with talent. And the Amiga is more creative than the ST design by far. There is No such thing as a 40% failure rate for early STs. That would have meant roughly 50000 toast STs in the first year. Wild accusation that must be embedded in Amiga Myth. Actually have 5 early 520ST with external disk drives, I would be willing to challenge if they used any solder:-). Clearly I have two broken ones:-). Nope. But the Gluechip and roms are generally loose. Virtually unexpandable but not impossible.

The A1000 is expandable, what can I get for it?
The A 500 memory upgrade was easier, but everything was just as tricky as the ST to upgrade. And many upgrades were similar between the two. The FAQ clearly mentions many ST mods as does the Udoit pages listed in this thread.

>What, a hacked CP/M/GUI/68K/DOS kludge is better then an OS specifically
>written to work 100% with the hardware?. Get real.

Actually that is exactly what it is. It was rushed together. The story of the creation of the ST is just as fascinating from a drawing board to production story.

Amiga OS clearly wasn't ready even when the A500 was released. It was awful. It simply took time to get it right. The ST on the other hand was ready, but it just wasn't finished:-). There is a difference. 12 years after owning my first A500, I still start to burn with anger. I hated it, and it hated me as it spent alot of time being repaired. If you want to talk about high failure rates, look no futher than the A500. Piece of shit.

>regarded as one of the best implementation for a home computer, still.
>Better check your Das Boot sources too.

I would be surprised if test to speech for the Atari ST was used. Amiga Text to speech was excellent. The STs sucked because of the Yamahas limitations. This doesn't mean the sound wasn't created on an ST, I just doubt that text to speech was used via the Yamaha sound chip. I would be willing to be they used a sampler instead or maybe captured text to speech off the Amiga:-).
>
>The Amiga is far better supported, with more addons then you can poke a
>stick at.

Some are better supported than others. Not all amigas are created equal.

>Now that is just plain BS. Amigas are still being used for professional
>quality video, art and sound production, as they have always been used for.

This has changed so drastically it is hard to comprehend. Really on the diehards are left as the writing has been on the wall for quite sometime. The other problem is the superiority of the PC for professional quality video. The Amiga can do it as it always has, with some excellent tools, but it just isn't the same anymore. There is too far to go to catch up.

>Most Atari's where used for games also, and in any case, the creative use
>of Amigas is well documented.

??? Ataris were regionally based uses. Amigas were used for games and video. Nothing more, nothing less. What it did it did excellently. Other areas were severly lacking and never did come to fruitition. That is why the ST was always around. Of course up until the mid 1990s there was no way a PC would be used by us it was just garbage. Ataris never caught on in NA. They were games machines in Britain. And in the rest of europe they were treated like a real work computer.

Anyways, Take it easy. I feel like fooling around with a A1000 now. I don't think I will move to the modern Amigas. Nor would I be in line for a Hades or Milan. I gone to retro:-). I find that these supercomputer PCs which really are awesome, just bore the crap out of me.

Later Brian.

Depends how much effort you put into POV-ray! Bryce is nice (I've used a
demo on a PowerMac 7220/200), but POV-ray fits my bank-balance a little
better! :)

Bryce is quite quick (if you can call ANY rendering software that!) I do
admit, but for sheer value-for-money get POV-ray (free) and something
like EB-model (shareware?) for Atari and you can't go wrong to begin
with. Then you can move to Neon3d (if you've a Falcon) or Inshape...

Regards,

Chris Wilkinson,
/|\ ATARI Falcon030.

PS.I won't be doing ANY rendering for a while as my IDE drive has gone
kaphut! Typical !%$@#$^ cheap PC hardware!!! :-/

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE: $200.00 + $15.00 S&H
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, 1,
manual, System & language disks, and mouse cleaning ball.

GAMES: $5.00 each + $5.00 S&H
GBA Championship Basketball The Sentry
MetroCross Star Glider
Star Ray Shadow of theBeast II
Guild of Thieves Golden Path
AD&D Hillsfar Gold Runner II
Station Fall Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS: $7.00 each + $5.00 S&H
Habba Check Minder H&D Base Hippo Pixel
Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

ENTIRE PACKAGE: $250.00 +$20.00 S&H
BTW, I am not leaving the Atari scene.

Guess what ?

Connect a CD WRITER to a 520ST, load CD Writer Pro and start writing your CD's,
no "buffer underrun" errors encountered....

I would say that not only it is the sportscar of computing, but also the F1 in
computing....

Cheers from Belgium

Dennis

Hi Dennis,
Well If it can be done on an iMac, its not as simple as on an ST.
Are there even any USB CD Writers in existance yet? If not, and
if one is lucky enough to have a Revision A or B imac, you can
get a SCSI card for it. Only prob here is that the installation
of the card is suppose to be*very* tricky, and as I said, only
the first imacs can use it.
It should be said that I didnt buy this iMac, we had a flood in
our basement and lost some computer equipment. Insurance wanted
to buy us PC replacements, I said no, so well, to make a long
story short I ended up with this. ..
I actually wanted a Milan, but thats another story..

But what other 15 year old computer can offer you 24bit graphics, 16 bit
sound and G3/G4 performance?. Still a bit of life left in the old beast.
Granted, the A1000 had some failings, but the early ST's weren't any
better. Their failngs just differed.

> the ST to upgrade.

What's so hard about plugging something onto the expansion port?.
The A500 didn't just have the trapdoor expansion, both the A1000 and A500 had a expansion port.

And many upgrades were similar between the two. The FAQ

Perhaps yours was a lemon.... ;-)
My A500 has never had a problem, except for a leaky trapdoor RAM expansion RTC battery, which is a common problem with any computer over 5 years of age.

The A600 is poorly supported (deservedly so, it's crap), but I can't think
of any other Amiga model that didn't have a good variety of hardware
expansion. Sure, some hardware limitations of the old Amigas (A500, A1000)
meant that they couldn't be expanded beyond a certain limit. If you wanted
expandibility, you bought a big-box Amiga. That is a nice option to have
;-)

For the extra level of functionality that you get with a PC, the added
expense is usually the prohibitive factor. PC's have only just overtaken in
this field, and not due to quality but speed.

Sure. Check the specs on the upcoming G3/G4 Amiga upgrade boards from
Escena, Phase V or the AmiJoe for some interesting developments also on the
other side of the fence.

New Icons and Magic WB are simply enhancements which don't affect the
operation of Workbench in any real terms. Some Amigans don't like MUI
because of the extra overhead, but I personally can't see what the fuss is
about. It's rather excellent as a programming aid.
OS3.5 will sort out these issues in any case.

:-^

Amiga Inc. is now a subsidary of Gateway, has new machines in development, is co-producing an OS upgrade (3.5) and therefore still supporting "classic" Amigas.

Corel has just announced that they will support the new Amiga, as have the Bitmap brothers, and Adobe is rumoured to have taken a serious interest in obtaining developer machines.

Last I heard, there was zero chance of Atari Corp making a comeback, which is ofcourse rather unfortunate as the combination of shithot Amiga and Atari machines would most likely impact Apple sales to the point where even Microsoft couldn't bail them out.

Nevertheless, NG Amiga sales alone will probably achieve that result.

About 2c worth...

Regards,

Clockmeister.

Last I heard, Gateway decided to not go through with a new Amiga unless a third party developed the hardware. This news was about 2 months ago. Is Gateway acting incompetent by changing their minds every 3 seconds or have they found somebody stupid enough to develop this bull* machine I have read about? (I am pro-Amiga, but it's a shame that Amiga, Inc and Gateway are so full of *.)

>
> Corel has just announced that they will support the new Amiga, as have the

Where's the article, on the net or anywhere else? Why should we look for evidence to support *your* claim? You must give us the evidence as well, you see.

One other point. Corel and Adobe and the rest NEVER GAVE A BLOODY DAMN when Commodore had the Amiga. Why the change, now? Their respective CEOs got testicle implants thus they finally have the balls to support more than Windows?

>
> Last I heard, there was zero chance of Atari Corp making a comeback, which

Don't count your bullets until they're shot. But I do agree, anything to knock down Wintel and anything which would obliterate Apple off the face of this earth would be a very good thing, indeed. (I'm very anti-Apple.)

>
> Nevertheless, NG Amiga sales alone will probably achieve that result.

Let's wait until it comes out. Meanwhile BeOS is quite the acceptable alternative and costs a hell of a lot less than QNX or whatever rubbish OS the NG Amiga will have...

AmigaOS 3.5 is a farce, too - considering the latest system requirements and what you get in return...

> About 2c worth...

True. Amiga these days is about that much in value. :-(I'll stick with my original A3000 and my emulator, thanx all the same.

It's nice to dream...I can see how this plays in the market..."Whats an
Omega?"

I hate to say it...The new Amiga what ever it is will never be a mass market
item again..

If any indications...the pricing of the new Amiga(s) will be priced out of
the stratosphere.. I just saw the latest Amazing Computing which is moving
to large print to stay afloat and fill pages had ads for 060 Amiga clones at
$2499...

Bengy Collins <collin@bulli.com> wrote on 4-4-1999 :

Hi Bengy,

>Well If it can be done on an iMac, its not as simple as on an ST. Are there
>even any USB CD Writers in existance yet?
No USB CD writers for the moment, let alone drivers...

>if one is lucky enough to have a Revision A or B imac, you can get a SCSI card
>for it. Only prob here is that the installation of the card is suppose to
>be*very* tricky, and as I said, only the first imacs can use it.
Possibly, but that means doing a hardware hack, which is not what this thread
is about.

>I said no, so well, to make a long story short I ended up with this. ..
>I actually wanted a Milan, but thats another story..
I was not attacking you or any iMac user for what it's worth. Because according
to TiFKAS the iMac is outselling everything else and contains the latest Apple
super duper technology I thought it was only fair to compare a 15 year old
computer to the best Apple has to offer....

So no CD Burning, no serious MIDI applications or hardware...
I gues Brian is right....a $5 520ST with TOS 1.0 RULES!!!

Cheers from Belgium
Dennis

3646. Transistor shortage threatens entire industry

[Article crossposted from comp.arch,comp.sys.intel,alt.folklore.computers]
[Author was David E. Fox]
[Posted on 01 Apr 1999 07:44:58 GMT]

FOR IMMEDIATE RELEASE

Sunnyvale, CA (AP): Intel spokesmen today announced that because of an impending shortage of transistors that they would have to shut down their Pentium III fabrication line and retool their fabrication setups for earlier-generation processors, such as the 8080 and 8088.

An intel spokesman commented that these new processors use so many millions of transistors each, and with all the processors we're making, this shortage (which has been fore-seen by many) is, well, inevitable. There are just simply not enough transistors to go around, and if the current rate of usage keeps at it, the world will be out of transistors by approximately June 30, 1999.

"Current generation Intel chips (Pentium III) use 5-6 million transistors per CPU. By comparison, the 8088 only needed 29,000, and the 8080 only needed a few thousand or so. Thus for us, retooling is the best solution to this problem", said one Intel company spokesman. But it only delays the inevitable.

After the announcement, Intel company stock dropped a bit, but surprisingly, valve (vacuum tube) stock was the highest it had ever been in years.

What makes a computer dead?

Well it all comes down to the user! The age old war of 'my computers
better than yours' has been answered many times and doesn't take a brain
surgeon to work out the answer!

Every computer has it's strong and weak points. The Amiga's strong point
is that it has some nice games!

I bought the A1200 when it first came out and run it alongside a
standard half meg 520STFM with a slow 120D+ printer, and running at 8Mhz
the Atari left the A1200 standing.

For serious software they are more reliable than PC Windoze, but are
still prone to crashing for no apparent reason. The best Amiga I've
owner IS a CD32, which I still have. If only the A1200 was as
accommodating:)

If you haven't worked out yet what makes a computer to die, then I'll
tell you;)

It's its user base. And I can tell you that the Atari side of things is
bigger than you think.

The thing that makes Atari computers stand out amongst the crowd is it's
MIDI (Musical Instrument Digital Interface, if you didn't know) as
STANDARD. Why copy Korg etc. when you can use the real thing.

Did you know that some of Sierra's software allowed the music in their
games to be played via MIDI!!!

I get at least 5 calls a week from musicians, all have got PC's and NO
Amiga. What's more they all say the same thing "The PC's MIDI timing" is
useless (I can't use their exact words, I'll let you figure out the word

used).

Before announcing a computer platform as DEAD you must look at the history of the platform.

I'll only be brief here, if you want any more info then use a search engine 'www.yahoo.com' is a good place to start;)

Atari 2600:
Still used. I think this was the first proper games console?

Atari 9-bits: 400, 800, 600XL, 800XL, 65XE.....
Definitely still has a BIG userbase. Not bad machines, nearly twice as fast as a C64 and with 4 channel sound and can use 16-bit sound!!!

Atari ST:
Still supported widely. Was the first computer to have MIDI as standard. Had/does have a wide user base, and can be found in recording studios and SCHOOLS. They are still being used on and in TV and films;) The STE version had hardware and improvements that let others behind.

Atari Falcon:
A 32-bit version of the ST's with added woosh. Real time audio processing and dedicated DSP processor gave it a world of it's own.

Atari Jaguar:
FIRST 64-bit console.

Atari LYNX:
First COLOUR handheld console and the only one that catered for left and right handed users.

Atari Portfolio:
First 16-bit pocket size computer.

Atari STacy:
Atari's portable ST.

There are ones I've missed, before everyone tell me so;) Although the brand name, the computer section, is owned by Hasbro the Atari as a TOS platform is STILL in production. The last one I looked into was the Hades 060.

Now before you make other silly statements, I suggest you do some homework before you employ your keyboard;)

The Atari platform is far from being dead, as it has a BIGGER user base than the Amiga. Don't forget that Atari was responsible for the Amiga, as Atari commissioned the project. Hey they come with a PSU build in, no foot warmer;)

The Atari have some brilliant bad points: STFM's sounds, the revolutionary place for the joystick and mouse ports... I can't think of any others.

Now lets come to the phrase 'deader than..'. What does this mean! How can anything be deader than another. I thought when something is dead it's dead. Let's say my neighbour and myself both had a cat and they both kick the bucket, now they both are dead and you can't get much deader than dead!!!! To make that statement make sense, one has to be dead and it definitely isn't the one I use! OR the people that have ONLY just discovered them;)

I gues you still believe in Santa Claus also?
These machines are not for sale, in my book this is VAPOURWARE.

Atari TOS based OS machines are for sale right now, and there is a user base out there buying them and using them..... I suppose these people are zombies? Open your eyes man... Amiga Inc. is nothing more then a commodity currently owned by Gateway, for all you know Micro$hit could be the next owner-))

So, before coming in this newsgroup and pronounce us dead, take a very good and looooong look at your own platform. The 3 piece suite guys are preparing the funeral of Amiga Inc.

The Atari community is alive and kicking, we're ready for the next century, and if all goes well Brian Van Tilborg will post a message in 2014 praising the virtues of his 30 old years 520 ST.

Atari users/owners have always been the underdog, this has made us strong, it made us stick together, and internet has strenghten this, we're in contact now with people all over the world with the same passion, we've transformed from a simple computer users group to one big happy family. If you attack one of us, you attack the whole bunch.....

And as for new software, we're doing just fine thank you, which can't be said for your platform.....didn't SoftLogic bite the dust? Oh boy no more DTP on the Amiga Platform, another one bites the dust -)))

Cheers from Belgium

Dennis

Yep, that was about 2 cents worth alright... (just kidding!) ;-))

Seriously, I was glad to see Gateway show some (non-PC) balls
and back the Amiga. Bet Gates lost some sleep after getting
reports of that! ;-)

About Atari Corp. You're right - I doubt they will ever return
and...so what? You'll find most Atarians have very mixed feelings
about them. Much like Amigans feel about Commodore. Ever heard
of the Milan? Very nice, fast '040/'060 TOS clone, that, from
all accounts, is doing very well in Europe.

Later... ;-)

Yes, there have been a few complaints, mainly from those that have
minimalist systems ;-).

Yes, there are a few now. I don't follow the soundcard market very closely
as I don't have a great deal of interest in that department. For the few
MODs that I have written, and for listening to other peoples creations,
Paula does the job pretty well.

I do know that there are sub $300 cards, from different manufacturers and
also one particularly expensive (and rare) card which is basically a
recording studio on a card.

Not yet he hasn't. Gateway and MS have had an uneasy relationship for quite
some time. (well before Gateway aquired AI)

> About Atari Corp. You're right - I doubt they will ever return

Your right there;)

A multi-tasking disk based OS that's more stable than Windoze;)

*.)

QNX are developing the kernel (check the QNX website for more on this), and
Amiga are going to do their own hardware in conjunction with other
partners.

Amiga Inc is now combined and have relocated. Jim Collas, Gateway's
vice-president, is now head of Amiga Inc and wants results, not BS.

Everyone is sick of the AInc BS. That is the reason Jim Collas was moved to
the helm IMO.

Because C= didn't give a f#ck about Amiga, so why would anyone else?.

Their respective CEOs got
> testicle implants thus they finally have the balls to support more than
> Windows?
>
If you haven't noticed, the industry is in recent years much more receptive
of "alternative" OS's. With crowds of users moving to Linux, and the sudden
interest in supposedly "dead" platforms by consumers, it is in their
interest to take notice.
One drop of rain can be the start of a flood after all...

BeOS has little support, despite being a very good OS. You may be
interested to know that BeOS was inspired by AmigaOS.
QNX is a very good OS, surely you can't dismiss it that easily?.

> AmigaOS 3.5 is a farce, too - considering the latest system requirements
and

Amiga has made a lasting impression on a lot of people in the industry, and
a good one at that.

>
> I hate to say it...The new Amiga what ever it is will never be a mass
market
> item again..

That remains to be seen. Regardless, another alternative would be nice.
Actually, considering that the PC/Mac are only surviving on hype and BS in
the currently stale market, I give a new Amiga a half decent chance if it
too delivers on the promises.

> If any indications...the pricing of the new Amiga(s) will be priced out
of
> the stratosphere.. I just saw the latest Amazing Computing which is

moving
> to large print to stay afloat and fill pages had ads for 060 Amiga clones
at
> $2499...

I was referring to the new Amigas from Amiga Inc, not classic clones.
In any case, I can get an 060 upgrade (and soon G3/G4) plus graphic card
for my A2000 for much less then $2499.

You went pretty easy in your reply... I expected much worse.
I don't suppose you have a soft spot for the Amiga do you?.

Regards,

Clockmeister.

preparing
> the funeral of Amiga Inc.

Funny. I guess the put the vice president of Gateway in charge of Amiga Inc
just so he could hammer the final nails into the coffin. Just why would
they be hiring all those engineers I wonder...

Can't you simply admit that Atari Corp is in a worse state then Amiga Inc?.
In that sense, Atari IS deader then Amiga Inc.

> The Atari community is alive and kicking, we're ready for the next
century,

I remember hearing in those days that the Dire Straits "Money for
nothing" video (the one with the "cubic" movers) was made on an ST,
because they couldn't get their hands on an Amiga or a colour Mac at the
time. Can anyone confirm this ? What software was it made with ?

>> for some STe's. How many Amiga clones exist today? And how many
>> laptops were made?
>
>Ask GateWay...The question is can you buy a TOS PPC laptop today ?

A TOS compatible laptop you can buy but not with TOS preinstalled. TOS
supports about all architectures but needs either Unix, Windows or
MacOS to be able to run on Alpha, Intel and PPC. The point however was
that Amiga had no clones and no laptop models. Atari do.

Please, next time only comment my writings in your replies to me. And I too beleive Apple is to stay, it fills a niche in the market. But still Mac's are far from perfect. Atari is perhaps limited by it's current hardware but damned it's about perfect.

Take your time and listen to the Amiga voice syntheziser and the Atari
Text-to-speech. Compare them to the Das Boot sountrack and to the old
Techno tunes. Then judge by yourself!

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the address below!

Cheers!

James

Did you ever read/hear about the ATW or the TT.

Falcon and the two above use multi processors (FPU and transputers)
The ATW even up to 8 or 12? IIRC.

MagiC is a preemtive multitasking OS, running all kind of ST software,
even some very old ones, like 1st Word Plus.
cheers

This must be a joke. Motorola is definitely the better CPU maker, but even the 6802 was just as inferior as the 8088 (only less so, the 808x were real crap.)

Where can I find a MagicMac demo, in english, as well as those
desktop replacement things?
There is no replacement desktop for the MacOS. It goes against
Apple's original plans for the Mac. And, of course, the Finder is good
enough, you don't NEED a replacement, unlike TOS/GEM...
Anyway, now I recall something called Greg's Browser, which isn't a
replacement per se, but it's a file browser, and it mimics the NeXTStep
file browser. It's no more than a curiosity.

Yes, of course, but it's just another case of
you-get-what-you-pay-for. POV produces bland, utterly useless output,
while Bryce is getting better all the time. Version 4 produces some
truly gorgeous, realistic scenery.

No, it's not Bryce that's quick, it's your Atari that's too slow :)
Anyway, I'd like to see some URLs for those Atari 3D software,
because I fear they might not be up to snuff, at least not when compared
to what's available (sometimes cheaply) for the Mac.

Yes indeed!

After a lengthy hiatus, the newsgroup comp.sys.atari.announce is
back. I have taken over as moderator, and just approved a posting, the
group's first in years.

I plan to update the group's charter, and will work with the Atari/Usenet
community to make the newsgroup as useful as it can be. c.s.a.a will be a
low-volume newsgroup offering news about Atari software, hardware, Web
sites, and other information relevant to Atari users. Articles may be
related to Atari 8-bit, ST, Portfolio, and PC clones.

I would appreciate your help in getting the word out about
comp.sys.atari.announce -- after such a long lull, I'm sure many
Atari-loving newsgroup readers have forgotten about this newsgroup. Of
course, I also invite folks to post any Atari-related announcements to the
group.

Hi Alexandre, - just for the record, there is actually several 3D software packets for the Atari range of computers among them is CAD3D - Cyber Sculp and Cyber Paint, a software suite made by some of the guys that is now working at Kinetic Software,- does 3DMAX ring a bell? Anyway,- Tom Hudson was one of the authors of CAD3D.

Try having a look at some of the Atari ftp sites, like ftp.funet.fi/pub/atari/
or at ftp.lib6.fr/pub/atari/. Some others to, but I can`t remember of hand.

They all have demos of the above software, NEoN, InShape, Xenomorph, and the some. But it is slow on any Atari computer that I know of, havn`t seen a Hades or a Medusa.

I don`t think there is a demo of MagiC Mac in english, you have to settle for the german demo. I think you can find it at ASH`s site.

There are demos of most of them on any Atari ftp site. A Falcon or TT
is a modest machine admittedly for rendering (16/32MHz 68030 isn't too
fast in todays world), but run POV-ray on a Hades060 and stuff that will
take 24 hours on a TT will take about 9 minutes on a Hades. And yes there
are Hades machines out there...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Where can I find a MagicMac demo, in english, as well as those
> desktop replacement things?

On my page, in the demo section, you can download the german demo of MagiC Mac. Then on the same page(The demo section of the download Bay) also grab THING 1.27 E which will be your english desktop. I prefer jinnee but as you need english, thing is the only modern *english* one out right now. English jinnee coming soon though.. (Just remembered, jump to the "Rscs" section and grab the partial translation of the *mac* side of MagiC mac, it will help you a bit in setting it up)

> There is no replacement desktop for the MacOS. It goes against
> Apple's original plans for the Mac. And, of course, the Finder is good
> enough, you don't NEED a replacement, unlike TOS/GEM...

I agree that it goes against apple's original plans, an example of this is how apple is not using the "THEMES" in the newer version's of MacOS, when I believe they have great potential (ie the NotePaper theme, or whatever its called, that apple made but banned..)
Where I do NOT agree is how you seem to believe that the Finder is good enough. Compared to Thing OR jinnee it PALES greatly in comparison, both in looks and functionality. (On the looks side, the only thing that finder might have is it's support for 32bit transparent icons in 8.5, as opposed to the max 8bit ones in all atari desktops)
For Finder, one has to load in control panels and extensions to even come close to jinnee, and still it's behind..example? Well here are 2 off the top of my head..
1) Window Backgrounds? In Finder, I use a utility called WINDOW MONKEY.. nice, but..
Yep, already built right into jinnee and better intergrated I might add.
2) Under Finder, I use "FinderPop" which is a control panel/extension which allows me to click and hold down the button on the desktop or over icons to do various actions such as browse through my C: partition quickly or delete an item. Under jinnee, once again this is built right into the desktop, and once again *much* more advanced and intergrated.

There are loads of other examples but in summary, Finder lacks in many area's. Even the principle of changing icons. Find the icon you want: get information: Highlight icon box: copy: finder file you wish to assign icon to: get info: highlight icon box: paste! I mean come on, it's so primative. Ofcourse there are easier ways to do it, but only with additional add on software. I could go on and on, there's just so many small things such as this. Another one. Under MagiC one can window shade a window, Iconfy it, AND hide it. Under MacOS? Only hide and windowshade, There is no "quick

way" to "minimize" the program's window.

Conclusion: Finder is not a bad desktop, but dont even try to compare or judge it against any of the MODERN atari desktops. Sure, I agree, With TOS/GEM you need a replacement desktop if you want to keep up, but come on, the GEM desktop hasnt been updated in HOW MANY years? And still it almost holds its own weight still..

> Anyway, now I recall something called Greg's Browser, which isn't a
> replacement per se, but it's a file browser, and it mimics the NeXTStep
> file browser. It's no more than a curiosity.

Yes I tried this out. On nice thing (actually quite nice) that macOS has is Kaleidascope which is truly fun and entertaining.. If any one is not familiar with it, you can download different "Schemes" such as Windows98, NeXT Step, Dracula, Halloween, whatever, and it transforms you computer to look like it. I hoped this would come to the MagiC platform in the form of winframes, since MagiC6.x people can now modify the way windows look etc, but it has yet to catch on. There are 3 "themes" for MagiC all done by the same guy in the "Theme" Section of MagiC Online.

Very true. I was an Atari computer user for, gosh, at least a decade,
my last machines being a Falcon and a TT. I loved Atari machines but am
now using an iMac at home but only because I work for an Internet
company that is all-Mac (have a new G3 at work :-)). Anyway, my point
is that MagiC made Apple's OS look abysmal in the area of multitasking.
The next Mac update (8.6) is supposed to begin to address this but I'll
keep you posted :-).

Scott

The Atari and Amiga Jihads should consider a Evangelist list to spread the gospel. Worked for Apple... Imagine countering the Atari/Amiga negative news infested by uninformed press and the well rounded and informed sinclap's of the world...-)

Apple's head cheerleader hangs up pompoms

Copyright © 1999 Nando Media
Copyright © 1999 Los Angeles Times Syndicate

By JOSEPH MENN

(April 25, 1999 9:09 a.m. EDT http://www.nandotimes.com) - Guy Kawasaki, the unorthodox former "chief evangelist" of Apple Computer, is closing up shop, satisfied he's no longer needed.

Even after he launched Garage.com, which matches start-ups with venture capitalists, Kawasaki had continued to flog the misinformed in the press and the public and to tout the virtues of all things Apple through his EvangeList newsletter and Web site.

Last week, he told about 40,000 of the faithful that his services were no longer needed.

"In the past two years, Apple has experienced a stunning turnaround. This is due to many things, including the steadfast loyalty of Apple's customers - and EvangeListas are the most steadfast of the steadfast," Kawasaki wrote.

"The original purpose of EvangeList was to counteract the negative news about Apple and Macintosh, and I believe that EvangeList has served its purpose - fantastically, as a matter of fact. So after discussing what we should do with EvangeList with the folks at Apple, we've decided to retire the List."

Rhona Hamilton, an Apple spokeswoman, agreed that the newsletter "really served its purpose." Now the company has its own electronic news bulletins, and many Web sites are devoted to the Mac and other products.

"We think everyone will be taken care of," she said.

The Atari and Amiga Jihads should consider a Evangelist list to spread the gospel. Worked for Apple... Imagine countering the Atari/Amiga negative news infested by uninformed press and the well rounded and informed sinclap's of the world...-)

Apple's head cheerleader hangs up pompoms

Copyright © 1999 Nando Media
Copyright © 1999 Los Angeles Times Syndicate

By JOSEPH MENN

(April 25, 1999 9:09 a.m. EDT http://www.nandotimes.com) - Guy Kawasaki, the unorthodox former "chief evangelist" of Apple Computer, is closing up shop, satisfied he's no longer needed.

Even after he launched Garage.com, which matches start-ups with venture capitalists, Kawasaki had continued to flog the misinformed in the press and the public and to tout the virtues of all things Apple through his EvangeList newsletter and Web site.

Last week, he told about 40,000 of the faithful that his services were no longer needed.

"In the past two years, Apple has experienced a stunning turnaround. This is due to many things, including the steadfast loyalty of Apple's customers - and EvangeListas are the most steadfast of the steadfast," Kawasaki wrote.

"The original purpose of EvangeList was to counteract the negative news about Apple and Macintosh, and I believe that EvangeList has served its purpose - fantastically, as a matter of fact. So after discussing what we should do with EvangeList with the folks at Apple, we've decided to retire the List."

Rhona Hamilton, an Apple spokeswoman, agreed that the newsletter "really served its purpose." Now the company has its own electronic news bulletins, and many Web sites are devoted to the Mac and other products.

"We think everyone will be taken care of," she said.

1) the Atari and Amiga "Jihads" are only a figment of your fevered paranoid imagination.

2) as far as you being "well-rounded and informed" - well, seeing as you've been caught making up stuff about Ataris out of whole cloth, or using info from rags like the Daily Tubby to bolster your SJR-DF&#65533; claims, and it looks like you're about to do the same with Amiga, we all know how suspect you really are.

<snip>

too bad Guy Kawasaki hung up his pom-poms, as Apple was hit with two bits of bad news this week....

1) Best Buy dropped the iMac completely from their stores, citing Apple's inflexibility in supplying them with the proper proportion of colours, and mentioning that they were fearful that they wouldn't sell. This of course meand that Apple now has only one national distributor...

2) Avid - a major player in the video-editing field - announced that the latest version of their Mac video software would be its last, and that all new development would now be focussed on Windows NT. Needless to say, Mac users are really ticked off....

>--
>Peter S.
>PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

which of course, is overstocked at the warehouse, and even cutting the price down to fire sale levels aren't getting them moving....

>Buy AAPL Stock...

why, when the movement of value of Apple shares is going DOWN? Seems Wall Street isn't affected by the Reality-Distortion Field&#65533; either. Is TiFKAS shilling the stocks because he knows that, if Apple's value doesn't go up, Steve Jobs will start another round of job cuts, starting with HIM?

"Every story you've ever heard about Steve (Jobs) is true. Working
for him was the greatest experience of my life that I wouldn't want to
repeat" - Guy Kawasaki

Hello???. You said...

> > > But how do you really know when there is no apps to try out this
multi-
> > > tasking...? Hack and slash poor apps are not real world tests..-)

Since when do you need "new software" or "updates" to try out "this"
multitasking?.
```

"Real" mulitasking works whether you're using old or new apps, and if you're suggesting that the Amiga doesn't make full use of multitasking for the apps that are out there you must be on drugs.

Ofcourse, Amiga (and Atari now too as I understand, although not from personal experience) have a "real" multitasking desktop OS, unlike Apple.

You can have all the apps in the world, but can *you* try out pre-emptive multithreaded multitasking on your current OS?.

Can't you at least admit that Atari is deader then Amiga ? :-)

Regards,

Clockmeister.

Some would say that an '060 machine is pretty modest as well, in the real
world.

<humour>

Subject: Whats the best OS?

Answer: Anything by Microsoft.

It never crashes, uses little RAM and disc space, and runs very fast.

Bill Gates told me - and he wouldn't lie to me, would he?

</humour>

Does this mean they have it working and that I can use Wordsworth on a 2
meg A1200 and produce a quarter of an A4 page with an image WITHOUT it
crashing....

Any one of my HALF meg ST's can do that, in single tasking!

>
>Ofcourse, Amiga (and Atari now too as I understand, although not from

The Atari has had multitasking software for a long time, what's the
Amiga's excuse!

>
>You can have all the apps in the world, but can *you* try out pre-emptive

>
>Can't you at least admit that Atari is deader then Amiga ? :-)

Walk into ANY decent music studio around the world, and how many will
have an Amiga in!!!! Not many.... It still doesn't come with a MIDI as
standard, I'll spell it for you; musical instrument digital interface.

Many musicians are using their ST's for their music. This is due to the
useless midi that the PC tries to imitate.

Now the Amiga is alright for repetitive House & ACID type of noise that
you need drugs to find entertaining; you know the sort of 'so called'
music they have on 'Trainspotting' TV program; sounds great when your
totally pissed;) Hey my kids can do it well... chopsticks using a synth,
sorry Amiga couldn't cope with that either.

Curious, when was the last time YOU saw an Amiga in a film, publication,
or documentary!!!!!! Hey if it wasn't for Atari the Amiga wouldn't
exist! I wonder why Atari turned the project down when they commissioned
it!

There's another thing that Atarian's are good at, we support our third
party software producers and prefer ORIGINAL software. Why is it that
the Amiga user prefers to pay ï¿½2 (GBP) per DISK for PIRATED software,

rather than pay ï¿½2 (GBP) for the real thing and some of the programs had 2/3 disks!!!!!

I had nearly 100 ORIGINAL software packages, ALL popular titles. I gave up trying to sell than as when I mentioned that these are originals people weren't interested!!! I gave them my nephew to take to school and give any of his friends that have Amoeba's. This is not fiction, but FACT.

3703. need Atari testers for multi-media CD-ROM

Newsgroup: comp.sys.atari.advocacy
Date: 1999-04-25 00:00:00 UTC
From: merefbast@aol.com
Message-ID: <19990425193926.03792.00001653@ng30.aol.com>
Source record: 3366

Please be patient with me. I know we don't have this
all in order, but we are trying....If this is the wrong newsgroup
for posting this message, please don't flame me to badly....

I work for a non-profit organization, Help Eliminate
Marijuana Prohibition (H.E.M.P.), making an educational
CD-ROM (called the "Electric Emperor") on the uses of
hemp (medicine, food, fuel, fiber, building materials,
plastics, oils, etc.) and the history of marijuana
prohibition.

The first version of the CD-ROM was Macintosh only.
The second version was Macintosh and Windows 95. The
third (and most recent) version is an attempt at true
cross-platform, reaching Amiga, BeOS, OS/2, plus LINUX,
FreeBSD, OpenBSD, NetBSD, and all the various other flavors
of UNIX (free or commercial). Or at least, that is the goal.

To be perfectly honest, we're really not sure how
well we did this (all our work is done on old 68000,
68020, 68030, and 68040 Macintoshes). We have made a
limited press run of 1,000 disks for working out the
bugs and are offering these disks to brave souls
willing to test them out and find out what goes wrong
(we're certain there will be things that go wrong) and
help us document what is needed to get the multi-media
presentation running cross-platform.

The third edition of the Electric Emperor has the
following items (still to be determined how much is
playable on various platforms):

(1) The complete 1942 USDA film "Hemp For Victory"
in QuickTime movie format with CinePak CODEC.

(2) The complete text (11th edition) and pictures
(samples from all 11 editions, many colorized) from
Jack Herer's "The Emperor Wears No Clothes: The
Authoritative Historical Record of Cannabis and the
Conspiracy Against Marijuana and How Hemp Can Save the
World!", the number one best selling book on hemp. The
text is presented in a series of plain 7-bit ASCII text
files and in HTML 4 (with pictures and other multimedia).

The HTML presentation is the heart of the
cross-platform multi-media presentation. With

Netscape's browser and Adobe's PDF players being near universal, MacroMedia's ShockWave spreading across platforms, and widespread availability of third-party QuickTime players, it should be possible to present this education information in an interesting manner regardless of platform. Notice the word "should." An important part of this experiment is finding out what really works cross-platform and what needs to be tweaked.

(3) Three music videos on hemp in QuickTime movie format with CinePak CODEC. These are "Intro" (a brief overview of the uses of hemp), Michael M's "Hemp Hemp Hooray" (medical uses of marijuana), and Jack Herer's "Jak Rap" (history of prohibition).

(4) Four Director ShockWave movies (one is a player for the SWA music, the other three are animations on the uses of hemp).

(5) Several donated web sites, including very large sites form the Finnish Cannabis Association (including materials in both English and Finnish, lots of historical information, the hemp movement in Finland, and a Jamaican grow guide) and the Marijuana Policy Project (including lots of information on state and federal laws and information on how to be an effective activist).

(6) Several hemp-related PDF files.

(7) A couple dozen songs in AIFF format. The songs are also repeated in MacroMedia's SWA format.

(8) Compressed copies of many of the pictures. Compressed using Stuff-It format. Uncompresses into TIFF and EPS files. Ready for use in print media and school reports.

(9) Compressed copies of Jack Herer's voice commentary. Compressed using Stuff-It format. Uncompresses into System 7 SND files. Ready for use in radio and video media.

(10) The original custom reader for the Macintosh. Not at all cross-platform, but it is on the disk.

If you are brave enough to try out a CD-ROM that certainly still has bugs and help us get this working in a true cross-platform manner, please contact Stephen Saunders at majik@majik.org, 1-888-HYPERVUE (toll free from within the United States -- not at all sure how that works for overseas), or 0=2, PO Box 4083, Balboa,

Calif, 92661, USA. The cost of the CD-ROM is $19.95 plus $3.00 shipping and handling for the U.S. (I don't know the shipping costs for overseas). Payment can be in U.S. dollars (although mailing cash is generally a bad idea), personal checks in U.S. dollars, money orders in U.S. dollars, cashier's checks in U.S. dollars, or credit card (Visa, MasterCard, American Express, or Discover). Credit card payments will be processed by WebPrecision, a for-profit company. Provide your name, mailing address, and telephone number. If using a credit card, also provide the credit card number and expiration date. Checks and money orders should be made out to "0=2". Any "profits" from the sale of these disks will go to H.E.M.P. activities, getting modern equipment for the project (donations of computers, software, or related peripherals greatly appreciated), and paying off the cost of pressing the disks.

After you get the CD-ROM, address technical issues and bug reports to me (CatGuy@lamg.com or Merefbast@aol.com).

Thanks.....

A 60Mhz Hades is rumoured to give the same level of math performance as a 200Mhz Pentium. I have not seen this in real-life to confirm it but many Atarians now own Hades060. System Solutions provided the information about POV-ray tests.

BTW, what is the 'real' world? For a hobbyist computing person a Pentium200 is probably a dream machine, therefore so would be a Hades060 for an Atari user...

Remember that we're not trying to run the world with our Atari machines, so the performance you quote as being behind the 8-ball really is brilliant in the world people use the Hades060 in...

actually, it didn't. And, as I was able to prove by my own investigation, it was easy to find an iMac anywhere in Toronto during the time period stated, which negated the story. Even a Computer City salesman admitted that the article was "greatly overstated".

>
>By the way...I saw a PBS segment on the Toronto SWAT Team...Toronto looks so
>Americanize....What gives? Does it have a Navy?

actually, we DO have a warship out in the harbour. And we also have a castle. Sure Toronto has areas that look like the US (that's why so many movies are made here where we stand in for Chicago and NYC, and for much more cheaply), but we also have areas that look like areas of London and other cities.

oh, so this now negates your claim that Best Buy was just "waiting for new displays" just about a month ago. And, according to some reports, Best Buy was also blowing out iMacs for as little as $675 US.

Does this sound like a company that has faith in Apple? Nope.

nope, I predict a mass moving towards Windows boxes. No company
who's relied on Avid for past and current projects is going to suddenly
switch to another title and have to re-learn all over again.

Well, you're wrong. They've been announced, and Toast already
supports them.
There are even external IDE drives for iMacs now.

>

This is nonsense, all cosmetic crap. It doesn't belong to the OS. I
use Finderpop too, I think it's nice too. I don't see what we would
benefit if it were integrated in the Finder.

>There are loads of other examples but in summary, Finder lacks in many

>

"Minimize"? "Iconify"? These are alien concepts to me. Just double
click on the window title, and be done with it. Why complicate if you
can make it simple? That's what made Apple famous, anyway... We don't
need 3 ways to get rid of a window...
I agree with the stuff about copying icons... But hey, how many times
do you go changing all yours icons?

>Conclusion: Finder is not a bad desktop, but dont even try to compare

Actually, with Kaleidoscope, you can have ROUND windows. Not only the
Finder is the easiest and most compact desktop, it's also the most
visually configurable, more so than the acclaimed X stuff.

Yadda yadda yadda... $19.95 for an Amiga MIDI interface, or I could buy a
soundcard for my Amiga with more features then you could poke a stick at.

> Many musicians are using their ST's for their music. This is due to the
> useless midi that the PC tries to imitate.

Agreed here. Timing on the PC sucks, even when playing MOD's!

> Now the Amiga is alright for repetitive House & ACID type of noise that
> you need drugs to find entertaining; you know the sort of 'so called'
> music they have on 'Trainspotting' TV program; sounds great when your
> totally pissed;)

I like real instruments, so this isn't an issue. I don't know what sort of
music is created with an ST, but if it's anything like the shit Celine Dion
and Mariah Carey put out you can keep it.

Hey my kids can do it well... chopsticks using a synth,
> sorry Amiga couldn't cope with that either.

Really?. So the ST has one single use... big deal.
NASA seem fit to use Amiga's, as does the British Naval forces, but what
would they know eh?.

> Curious, when was the last time YOU saw an Amiga in a film, publication,
> or documentary!!!!!!

My local newspaper had an article on Amiga just a few weeks ago. If I felt
compelled to watch the sattelite weather information on TV I would be
watching an Amiga generated screen.

Hey if it wasn't for Atari the Amiga wouldn't
> exist! I wonder why Atari turned the project down when they commissioned
> it!

Atari lost it, and tried to play catch-up since.

> There's another thing that Atarian's are good at, we support our third
> party software producers and prefer ORIGINAL software. Why is it that
> the Amiga user prefers to pay £2 (GBP) per DISK for PIRATED software,

Since when are we talking about the OS? I thought we were talking about the desktop shell? I think Window Monkey is cosmetic, not finderpop though!

> "Minimize"? "Iconify"? These are alien concepts to me. Just double
> click on the window title, and be done with it. Why complicate if you
> can make it simple? That's what made Apple famous, anyway... We don't
> need 3 ways to get rid of a window...

It does not complicate things simply by calling them by there correct terms. What you described for example is called "Window Shading" and takes a lot less time to type then "Just double click on the window title" Sure, You dont /need/ 3 ways to get rif of a window, but surely it would not harm you or be detrimental in any way.

> I agree with the stuff about copying icons... But hey, how many times
> do you go changing all yours icons?
>
Not very often, but when I do I must go through this tedious process.

> The Finder is the most consisent, and downright easiest to use
> desktop.
>
You could be right there. But, At this point those aspects of a desktop do not appeal to me that much. Maybe when I was a novice my main concern was how friendly it was, but now often times this "friendliness" gets in the way.

>
> Actually, with Kaleidoscope, you can have ROUND windows. Not only the
> Finder is the easiest and most compact desktop, it's also the most
> visually configurable, more so than the acclaimed X stuff.

Yep, actually you dont even need Kaleidoscope for the round windows. There was some rsrc's on one of the lasts MacAddict CD's that let you use them.. really really cool. I do agree that Finder is the most /visually/ config. desktop though, no question there.

I don't know...A P200 will still provide reasonable grunt for playing
Quake. Its only the dickhead PC retailers struggling for their 5-6%
margin who preach that you MUST upgrade to the latest greatest new
hardware every 6 months. Diehard gamers apparently buy the fastest PC's
but I reckon they're stupid...I'd rather buy a PSX and use it on a my
big screen telly and home theatre system...thats infinitely more satis-
fying than using a crap 15" monitor and speakers that sound like they
come from clock-radio technology...

> My dream machine isn't a PC, but if it was it would be a PIII 500 Mhz I
> should think.

Why? No software is written to use PIII properly yet...you might also be
under suspicion of all kinds of criminal activities once servers all
round the WWW note your PIII serial number! :)

You're living in the past... Playing a 3dFX game on a bigscreen TV (TV-out
is common on video cards now) with Dolby surround sound (The better SB
cards amongst others)
and a PII/PIII processor is a fantastic experience. The latest PC's are the
ultimate games machines, the PSX doesn't compare.
The PSX is good value for money though, and very portable which are it's
winning points. (Not to mention the availability of cheap imported CD's
from Asia)
(No, I don't condone piracy, and I don't own a PSX although many of my
friends do)

> > My dream machine isn't a PC, but if it was it would be a PIII 500 Mhz I

The average PC sold here in New Zealand doesn't have a card with TV-out
and those I've seen look terrible on TV, as PC's don't often have close
to PAL or NTSC native resolutions. Sound cards with Dolby Surround that
I have listened to are MUCH POORER cousins to dedicated Dolby Surround
amps. The final nail in the coffin for me is that a Playstation here is
cheaper than a 3dfx or Voodoo card...

> But the PIII is *extremely* fast at rendering, which was in part what I
> was commenting on.

Granted. The 'new' commands on the PIII are what I was refering to, as most
software doesn't even use PII commands properly yet...

> We agree on something :-O

I just don't want to be driven down the same tunnel as all the Wintel users
out there. Win98 is a pile of shit that makes even MacOS look good, and new
fast hardware to me doesn't fix a legacy of complicated over-bloated OS and
applications that Windows has been for goodness-knows-how-long. Workbench
or TOS/Magic (maybe MiNT!) are a breath of fresh air to use, and if anything
goes wrong I sit happy in the knowledge that it won't require an expensive
technician to visit and fix it on my Falcon...I can do it myself!

> Perth, Western Australia.

Perth, WA huh? Tell me my friend, how are employment prospects in Perth
today? Not as miserable as here in New Zealand I can bet! :-/

Gawd I should take up fishing too!...hook...line...and sinker!

Of course ANY computer with extras like printer, scanner, external hard drive,
etc...is gonna have a spaghetti mess of cables, but this iMac thing seems to
have the potential to really take this to new levels!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

They have the same resolutions as the consoles with a TV-out card. 640x480
maximum with PAL I believe.

Sound cards with Dolby Surround that
> I have listened to are MUCH POORER cousins to dedicated Dolby Surround
> amps. The final nail in the coffin for me is that a Playstation here is
> cheaper than a 3dfx or Voodoo card...

Sure, for most people a PSX is more then adequate but for serious gamers
with loads of cash a PC can't be beat. It's kind of ironic that certain
80's platfroms where dismissed as "games" machines because they had colour
and TV connectability, not to mention a custom graphics chip.

Fair enough, I agree. Some of the new PIII "features" are a little worrying
also.

It seems plenty of Kiwi's have found employment here, so things can't be
too bad on that front ;-)

It depends what line of work you're in I guess, but on a whole the WA is
doing reasonably well. Plenty of employment ads in the papers last I
looked.

Regards,

Clockmeister.

Hmm.. so you are suggesting that a professional who shoots on Beta SP (still BY FAR the most common format for pro video, and the same market segment who use AVID) is going to compress the video to the DV codec, and then transfer via firewire? Not likely.. FYI, professionals don't like compression.. and with faster CPUs and drives, uncompressed video is becoming more and more a reality for even the lower end pros. The only thing professionals like less then compressed video is unproven software and hardware..

Don't get me wrong, I'm looking forward to receiving my copy of Final Cut to use on my (work machine) G3 400... but don't be stupid enough to equate Avid and Final Cut.. they are tools for FAR different parts of the video market. Someone even moderately familiar with the pro video marketplace would know better!

FireWire and FCP complements the Avid solutions. Both will open and extend
the digital market further than Avid did. Not everyone has the dough to
spurge on the Avid stuff. But with the low cost of FW and FCP will
accelerate the video market further...

Avid is in the Mac market....

Wrong again. They do NOT compliment each other.. they are for ENTIRELY DIFFERENT SEGMENTS OF THE MARKET.

The people who will buy FCP are the videographers and low budget houses who would NEVER buy an Avid to begin with.

> Avid is in the Mac market....

Well, sure.. just for bug fixes/etc from now on. They have announced that the current version will be the last major rev for mac. New features will only be available on Win NT.

> > Don't get me wrong, I'm looking forward to receiving my copy of Final Cut to use on

..except YOU are the one who said AVID better watch out. YOU compared the two solutions, NOT me. Again, they are NOT EVEN CLOSE to being in the same market segment.

Yes they will...These new technologies will drive the market....FW and FCP
will accelerate this market. If Apple left it alone to Avid the market would
stagnate due to cost....Even I am cut the bug...Getting the creative amatuers
hooked will drive the highend market in the future..

> The people who will buy FCP are the videographers and low budget houses who would NEVER

You're missing the point as usual. RIGHT NOW, FCP HAS ZERO IMPACT ON AVID SALES. ZERO. Everything else you say is just conjecture.. and conjecture from someone who is NOT in the business. FCP is ideal only for people who SHOOT ON A DV FORMAT. MOST PROs DO NOT.

Granted, it doesn't take a brain surgeon to see that lowering the cost of entry increases the
market.. but NOBODY knows how that will affect the PROFESSIONAL Avid market.

Most people who work on AVIDs have NO room for error.. they work under quick deadlines, they
make a LOT of money, they need proven technology.. as close to bulletproof technology as possible. I can't even get the drivers for my ATI video card in my B&W G3 to load consistently.. and when it goes to sleep, one of the 2 internal SCSI drives doesn't wake up and
requires a reboot. I'm NOT trusting time critical work to this system, and most professionals,
for whom time is money, wouldn't either.

Merely anecdotal.. but the 2 people I know with Toasters still have them and haven't bought a
non linear system. Again, it's just a guess.. your guess is from a person who has a vested interest in Apple.. my guess is someone who works on an AVID daily. Who would you trust?

So their announcement means.. what? Do you even KNOW why they dropped Mac?

>
> Are you for real...Or just pretending to be someone that you are not?

Oh, childish Sinclar.. or TIFKAS, the nickname that I coined so long ago. I remember having
a
similar conversation with you about the Falcon and audio production YEARS AGO.. you weren't
even familiar with Digidesign Pro Tools, the MOST COMMON PRO audio editing system in the
world,
yet you continued to babble on about audio production and which platforms were better..

Your problem is you don't know what the hell you are talking about in certain areas, but
you
continue to babble. Face it.. YOU KNOW NOTHING about video editing, YOU'VE NEVER actually
worked on an AVID, you wouldn't know the difference between a Digital Betacam tape and a
Beta
SP tape if your life depended on it.. you are clueless.

I would NEVER even PRETEND to know all about Macs in general.. I mean, I have an 8600
running
Pro Tools on my desk, and 9600 running Avid Xpress Mac and a B&W G3 400 in my editing room
(not
to mention a 9500/180 MP at home), all three of which I maintain.. but I wouldn't get into
an
argument about their operation with you, because you probably know more then me.

But you on the other hand.. you DON'T KNOW WHEN TO SHUT UP. You get in arguments with
people
and you obviously in over your head.. and you seem to be too dense to know it.

You DON'T KNOW the video market, dude.. talk about what you KNOW.

BTW, anytime you're in northern CA, you're welcome to come by my office and see whether I'm
"for real" or not.

Hi there,

sinclair2246@my-dejanews.com wrote:
>
> Do you think that Sam And Jack T still use their now
> defunct ST or do they use an updated bad ass PC?

Probably not. Deep down in their hearts they may wish to
still be using an ST. Who knows, they may even look at
Bill Gates and think, 'Gee...if we'd done things just a
little different we could be like him...and everyone
would be using an Atari...', but then again they would
look at Billy boy and realise that many many people
really despise him for all he stands for...

They probably don't use ANY computer. Executive types
are known computer illiterates...I've worked for a
company where most of the senior level managers were
complete dead losses on the PC's. It was upto a small
number of low paid laboratory or admin staff to always
be rescuing a hapless manager stuck on how to save the
really neat 1 page Word document they had just spent 3
hours typing...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

They are to busy playing golf and having champagne lunches, too have the
time to work out how to switch one on let alone use one. A pocket memo
machine with it's 3 buttons is more up their street.

Joking aside, I went on a government course many moons ago, and there I
watched a people were left sitting in front of computers and not even
told how to switch them on!!!!

It wouldn't have been bad until you know that the personal managers got
ï¿½50 GBP per week for every person they were suppose to be responsible
for.

I ended up along with 3 other people, teaching the others, AND the
Nimbus machines had no software available; or should I say the software
was locked in a safe for ONE person's use, the company secretary who
never used them anyway!!!!!

It's a crazy world.

Take out the 'ass' and what do we have? A friend who was silly enough
to buy a Celeron 366 recently got a Philips Windows CE palmheld. This
runs of a serial link (from modem port). He plugged the palmhelds wee
cable into the spare modem plug...and it worked fine!! But now his sound
card is not able to be used. Gee isn't Win98 a crock of shit! Thats why
I WILL NOT BUY A FREAKIN PC! Mac isn't too much better either...

Source record: 3310

Ok, so I'm a bit of a techie and know my way around computers but I just haven't had many problems with my Win95 installation.
Going on two years without a reinstall (in fact I haven't had to do one yet, touch wood) on the same system.

Sure, I've had the usual GPF's and complete system lockups that are standard with Windows, and the multitasking is a pretty crap too, not to mention the slowdowns when things get heavy.

All in all though, I think that a lot of problems arise from users lack of knowledge and that other problems are extremely exaggerated by those who hate Windows solely for the monopoly it represents.

Has anyone in this group had a reasonably good run with Windows, or am I alone here?.

BTW, this isn't me advocating Wintel, far from it. It's just that only today I realized how long I've been running without a serious crash and it's got me curious...

Besides, things are a little quiet in this group ATM ;-)

Regards,

Clockmeister.

Well I'm using Windoze '98 and can only comment on 3.1 and '98. It's
been 6 weeks since I've had to re-install everything and I've been
struggling for 3 weeks. Another instal is due, and I'm awaiting delivery
of NT hoping that that's better.

>

Things get slowed down when you turn the machine on!

>

Lack of knowledge!!! Well that rules me out then.....

I had a good run with 3.1/3.11 and wfw 3.11.

I have come to the following conclusion; the number after the 'P', e.g.
p-120, p300 etc.. means the number of hours you can go without having to
reinstall:)

The idea is that you upgrade to a faster machine BEFORE the time
expires, and hence keep the manufacturers in a job.

BTW, why hasn't Intel released their 800 meg processor yet! it was
supposed to have been ready in Oct '98 ready for a March '99 release, or

they purposely holding back to call it a Pentium (TM) IV!!!

Techies (I'm half-pie one) may find getting a reliable system up and running on Win95/98 easier than non-techies. However, its the way that PC's are sold to the uninitiated that makes me laugh! These things are sold as reliable, easy to use tools that will really enhance your life in some way or another. Reality kicks in and sooner or later some system fuck-up occurs that requires a technician to fix. PC techs are becoming more common than PC retailers IMHO. M$ just keeps on laughing all the way to the bank...

Your situation is a rare one...professional IT managers at my former job couldn't even keep Win95 desktops running on an NT network without at least a few problems every day...

In conclusion Win95/98 are overly complicated beasts that really badly affect business/profitability in many organisations, who find themselves spending much time/$$$ on upkeep of systems rather than getting the work done...

> Besides, things are a little quiet in this group ATM ;-)

True. Disappointing really!

Apparently Sinplop has been unwell due to some excess 'palming'!

A typical scenario. BTW, Win98 is just Win95 with WinExplorer tacked on
with blutak. Nothing new in Win98 makes me jump up and say 'Gee, this
Win98 thing really does improve on Win95!...'

> I have come to the following conclusion; the number after the 'P', e.g.

I think you'll find its an inversely proportional equation. The model
shows that as the CPU gets faster, it takes less time to get to the
rogue system bug that hangs the machine, reorganises the FAT, and forces
a complete system re-install...

:)

The only time my Amiga has had a re-install was when I upgraded from 2.05
to 3.1. It didn't require formatting of the harddrive, that has never been
required for any reason.

It's a little more then blutak I can assure you. Have you tried removing IE
from Win98?. But your point is a good one. IMO, Win98 should have been
released as a free service update/bugfix.
That would never happen ofcourse as that implies that Win98 is bug-free and
that is clearly not the case.

Well in the UK when you buy a machine you get a supplier, a warranty company and the now familiar premium , rip off phone numbers at 60p and upwards.

99% of problems when you get a new system are software ones; hey will give you a program setup in a certain fashion, if you want to know how to stop something happening or why are these printer programs for a printer, you don't own, doing here!!!! etc.. You'll have to pay a fortune to get software help,

The hardware side of things are pretty simple if you know what you're talking about. The chaps, or chapesses, at the end of the phone try and throw loads of excuses about details they know nothing about. Then they will pass you onto the technical department, probably the secretary on a tea break;), who tries to tell you or convince you that they know what they are talking about. These only know what they are taught by the company or what they read out of a book!!!

If people took a leaf out of the Atari users book, things wouldn't be so bad. And if ye olde Gates took some time, from counting his dosh, to find out what his OS actually does, or more importantly it doesn't, and produce an OS that isn't just thrown together any old how. If a ï¿½50 half mag Atari ST can do it why not create one for the humble PC owner that's also reliable!!! Even the ZX81 was more stable...

Lucky you !

I have never got a windows based computer to run stable
and have worked with win95 from the day it was released (and litle before)
both at work and at home.

Windows is a big bug !

>Sure, I've had the usual GPF's and complete system lockups that are
>standard with Windows, and the multitasking is a pretty crap too, not to
>mention the slowdowns when things get heavy.

So you have problems ... ?

>All in all though, I think that a lot of problems arise from users lack of
>knowledge and that other problems are extremely exaggerated by those who
>hate Windows solely for the monopoly it represents.
It can maybe be users lack of knowledge but there is infact big problems
to maintain the system when it is not working.
Click clik... wait ... reboot ... click .. reboot ... hang ...
- reinstall ..
- missing drivers ..
- bad drivers .. crash ...
- reinstall ...
It can take hours to get the computer running after a small crash
and i dont like this as it is a commercial product i have paid for.

You can for example install Solaris (commercial Unix) and it works very well and stable
and you can install linux (it is free) and this works very well too.
But not windows.

Every time i am going to use windows for a very simple task
it gives me more work with system maintance than the real task.

>Has anyone in this group had a reasonably good run with Windows, or am I

LOL.
Not only that, it's a PS/2 and the HDD is running in MS-DOS compatibility
mode!
It did it to win a bet. BTW, when I installed it the 386 had only 4Mb RAM.
I added an extra 2Mb SIMM later.

> PS Can you actually run any -other- software on it? ;^]

Given enough patience, it does run IE3.0 and MSword V6 (for WFW3.11
admittedly).
It does give the 120Mb HDD a bit of a thrashing though ;-)

For practical purposes, I use my P166 which performs (marginally?) better
or my Amiga ofcourse.

Regards,

Clockmeister.

Stability is and has always been a problem, but I've yet to re-install from
fresh.

Sure. Right at this moment, Windows seems to think that my modem isn't
connected (it's internal) and not working properly. (no conflicts)
It's been like that for ages, but as you are reading this it is pretty
obvious that my modem is working perfectly well. It seems Win95 is a little
confused...

In my case, the Windows seems to run fairly reliably most of the time but
then I have spent quite some time in the past debugging problems.

I mentioned my modem problem in a previous post and yes, I agree, hardware changes do confuse Win95 and usually require some debugging.
Plug and Play is a load of crap.
I have changed modems, soundcards (that's a good one for headaches), video cards, and a network card.

Yep. My Amiga is much faster updating screens then the P166 Win95 PC also.

Spot on. The existence of this newsgroup is for Atari advocates to forward the arguments they believe put their platform ahead of others. Supporters of other computer platforms are allowed of course to debate the claims of Atari users and add their arguments against the Atari users as well. As an Atari advocate I welcome the likes of Peter Sinclair-Day into this newsgroup because a bit of light-hearted banter between supporters of different machines never did harm anyone. Its also quite amusing to read some responses too! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

> No brainer here..

No brainer, indeed. Again, pros shoot on BETA SP, DIGITAL BETACAM, ETC, NOT DV.You are so wrong as
to once again prove yourself a fool. Final Cut Pro is NOT anywhere near 80% of an Avid. On an Avid,
you have the choice of many different compression ratios, including near uncompressed video (not so
with FCP), a rock solid integrated system (not so with FCP), built in hardware accelerated 3d effects
(not so with FCP), component, pro inputs and pro balanced audio inputs and outputs (not so with FCP),
proven software that is SEVERAL generations old (not so with FCP), guaranteed performance of hardware
periferials (not so with FCP), a HUGE installed base with by far the largest market penetration (need
I say?).. etc etc..

Talk to me in a year or two when it's up a couple of revs, and you might be right.. maybe then FCP
will start to have an impact on Avid's sales. Now? You're proving your complete ignorance here.

Talk about WHAT YOU KNOW!

> > Granted, it doesn't take a brain surgeon to see that lowering the cost of entry increases the

>
> What do you not understand?

I don't understand what you said above.. it sounds to me like you're proving my point.. when people
who start out on FCP/Mac get "money/fees roll(ing) in" they will buy Avid? You're probably right..
how exactly does that negatively affect Avid's market?

> > > Are you for real...Or just pretending to be someone that you are not?
> >
> > Oh, childish Sinclar.. or TIFKAS, the nickname that I coined so long ago. I remember having a

> Can't win the debate so you attack the person....Typical Atari Jihad in
> Denial!

Hmm.. read what you just wrote about attacking the person? Er.. put, kettle? Keep talking, you're
proving my point for me.Once again, you refuse to comment on the bigger point.. which is, you DON'T
KNOW the first thing about the video business. You wouldn't have posted the above if you had a
clue. Only an idiot would contininue to defend himself in an argument where someone SO OBVIOUSLY
knows MUCH MORE then he does. Then, to compound the mistake, the ONE point he makes in response is
so CLEARLY demonstrative of his ignorance that I don't even really need to respond.

As far as "Atari Jihad," once again you are demonstrating your ignorance.. I don't care about what
platform I use, unlike you. I use whatever tool helps me get my work done most efficiently. I do
most of my work on my Mac system at home.. I do a lot of work on Macs and Windows systems at work,
but more Mac then Windows for audio and video work.

I don't blame you for trying to insult me, though.. you don't have the knowledge to actually debate
with me about pro audio and video.

Again, talk about what you KNOW!!

> > Your problem is you don't know what the hell you are talking about in certain areas, but you

Maybe anorak wearers would get pleasure from such a device
but I don't think I ever would because...

1. I don't have a USB port on my Falcon030...

2. My girlfriend would kill me!! ;^)

I could use it as an interesting ornament to sit on the
coffee table perhaps...a conversation piece? :)

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Agenda for the May 19th, 1999 Toronto Atari Federation meeting:

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

3783. Embarrassing question

Newsgroup: comp.sys.atari.advocacy
Date: 1999-05-18 00:00:00 UTC

Hello all,
I have made the plunge into my newly acquired 800XL and want to learn to program on it and I have a VERY embarrassing question.
How to I save and load from my 1050 floppy drive?
I have a book on game programming that came with a disk. I typed CLOAD and it started to load, but then I realized that there are most likely more than 1 program on the disk. The disk isn't labeled so I need to know what is on it. How do I find out the names of the files on the disk and how do I load those files (I assume CLOAD then the name of the program)? I assume saving a program is similar.
I am too used to DOS and Windows...
Please e-mail me at delliott@nac.net and don't be too hard on me.
Thanks,
David
PS I'm sure the same holds true for my 410 program recorder too...

Right....

the same for LIST and ENTER commands also...

The commands in ATARI BASIC is as follows:

LOAD "D:FILENAME.BAS" - D is for disk drive, if you have more than one
disk drive then you can use LOAD "D2:FILENAME.BAS" this will load the
program FILENAME.BAS from the second disk drive.

To save a file it is pretty much the same SAVE "D:FILENAME.BAS" etc..

You can also load then run a file by RUN "D:FILENAME.BAS"

By typing DOS you can get a menu of DOS options.

Filenames have the same rules as MS-DOS on a PC, including wildcards.

Disk directory can only be seen by going into the DOS menu and
selecting A.

Hope this answers you questions.

There are no embarrassing questions. We all had to start somewhere.

Firstly. is DOS loaded???
To load dos, turn on drive, instert the disk, close door then turn on
the computer.
you should hear a series of beeps comming from the speaker thenthe
ready prompt.
Anything else like errors or no loading at all means something is not
working.

From basic, enter DOS for the dos menu.
From dos, B to enter cartridge (basic).
From basic LOAD"D:program.ext. where program.ext is the name of the
program you wish to load.
SAVE"D:program.ext saves your program.
LIST"D:program.ext Lists the program to disk.
ENTER"D:program.ext Enters a listed program from disk.

The last two instructions do have a use but are not mandtory.
They are used to clear out the vairable table of unused vairables
because Atari basic can only have 128 vairables.

CLOAD and CSAVE are used for the 410 only.

James.

BTW... I have no Atari DOS loaded on here... just the pre-loaded BASIC and I also have the Atari Assembler Editor cart. I have no way of knowing the filenames on the one floppy disk I have.

Interesting.. no response from the Avid Expert Known As Sinclap.. AEKAS. Maybe he has finally come to
the realization that he doesn't posess the knowledge to make an informed rebuttal?

That would be nice.. of course, TIFKAS/AEKAS would NEVER admit publicly that he doesn't know what he's
talking about.. that would actually take some humility and intelligence, traits I haven't seen from him
before. He'll probably choose to either ignore it further, or make a quip instead.. standard practice
when you don't know enough to make an intelligent argument.

Without DOS you can't read a disk, but most pre-recorded disks have some
sort of DOS. First you turn on the drive and insert the disk, then turn on
the computer. If it says "BOOT ERROR", you need to get a DOS disk.
Net-Tamer V 1.08X - Test Drive

NT is *much* better. Partly because Plug-n-play and all of the other 'easy
to use' (which is not easy for most machines) doesn't exist in NT.

It's faster and actually does preemptive multitasking.

Win95 says it can do preemptive, but only with 32-bit code. When you
consider Win95 has enough 16-bit code in the core of the OS, there's no way
in hell Win95 (or 98) will ever properly preemptively multitask. Microsoft
misadvertised. is that not illegal?

Let's go through this one by one:

Clockmeister wrote in message <01be9afb$ffc93dc0$a65e0fcb@default>...

>Sure, I've had the usual GPF's and complete system lockups that are
>standard with Windows, and the multitasking is a pretty crap too, not to
>mention the slowdowns when things get heavy.

That's typical for most OSes. When you have more apps open, the system will slow down then trying to pre-emptively multitask them all. Depending on how good the OS is, you can multitask more apps than on other OSes. Amiga, Mac, and Atari ST are in the same boat for locking up. And even Unix can have its day since nothing is perfect so don't say anything Unix techies. Stuff can happen with Unix, maybe not as often.

>All in all though, I think that a lot of problems arise from users lack of
>knowledge and that other problems are extremely exaggerated by those who
>hate Windows solely for the monopoly it represents.

I don't hate Windows. Rationally speaking, I can't hate Microsoft. Microsoft saw IBM was peddling a computer (a true piece of junk if you read up on technologies available in 1980...) Any one of us would have made the same decisions, given the opportunity. Any one of us who bothered to notice how big IBM was and Digital Research (IBM's first contact) was run by a truckload of cretins. This is why they turned IBM down! idiots, I have no sympathy for them...

IBM used its *name* to sell the product and give it the facade that it was for business. (I wouldn't sell a badly designed CPU which was slower than many other 8-bit and 16-bit CPUs of the time! The Motorola 68000 was made in 1977 and had more than the i8088. The i80386 (1985) finally caught up to the 68000 (1977)). The machine sold, of course, and Microsoft stuck along for the ride. Intel, who made the worst microprocessors of the time (and still do) had a larger role to play since Intel chose them (because the CPU was fourth-rate, even by 1980 standards).

In the end, it's IBM I cannot stand.

>Has anyone in this group had a reasonably good run with Windows, or am I
>alone here?.

I don't like Win95 because plug-and-play only works on very simple machines, if for nothing else. I use WinNT and I enjoy it, but I'd much rather use the Amiga - which was the most resource-friendly of the entire scope of microcomputers.

The only thing in favour of the original IBM PC/XT was the 80 column
display which was lacking in most 8 bit computers of the time. For anything
else, PC's where truely abysmal.

Any one of us would have made the

made
> in 1977 and had more than the i8088.

No shit. The Intel 8088 is a true masterpiece of retarded engineering.
Even today, the shortfalls of that monstrosity still come through on new
generation Pentiums.

The i80386 (1985) finally caught up to
> the 68000 (1977)).

Yes and no. The 80386 did have more features then the 68000 (like VM and
FPU support) and the 80386DX was a clean 32 bit processor unlike the 16/32
bit 68000. The 68000 was a cleaner processor though, and far superior to
the 80286 so my guess is that it falls somewhere in between the 80286 and
80386SX.

The 68020 was pretty comparable to the 386DX feature wise, and certainly
performance wise in the right system.

The machine sold, of course, and Microsoft stuck along
> for the ride. Intel, who made the worst microprocessors of the time (and
> still do) had a larger role to play since Intel chose them (because the
CPU
> was fourth-rate, even by 1980 standards).

Intel make a pretty decent processor these days despite the legacy. (not
forgetting the fact that the new generation Pentium CPU's are still just
over-glorified 386's). The rest of the PC architecture is a bit of a dog's
breakfast as well come to think of it.

> In the end, it's IBM I cannot stand.

You can't really blame IBM. After all, it was the gullible public that got
sucked into buying the damn things. No-one forced them to!.

But then, there are those people who are happy to keep spending money on
upgrades every six months or so just to stay current so I guess nothing
much has changed.

IBM did come out with MCA and OS/2 which where pretty reasonable
technologies at the time, but IBM shot themselves in the foot with MCA. The
licensing to use MCA in clones was super-expensive so the clone makers
simply didn't embrace the new technology. IBM got greedy, wanted it all

(including royalty on every MCA bus clone PC sold!) so the industry went another direction. (VLB, EISA, and eventually PCI).

That hurt IBM badly :-)

> >Has anyone in this group had a reasonably good run with Windows, or am I

> I don't like Win95 because plug-and-play only works on very simple machines,
> if for nothing else. I use WinNT and I enjoy it, but I'd much rather use
> the Amiga - which was the most resource-friendly of the entire scope of
> microcomputers.
>
Likewise, I'd choose an Amiga. It was the first (and only) computer that had that certain awe of excitement and WOW factor. That old A2000 of mine surprises me at times with what it can do, given the obvious age and hardware constraints of an essentially eighties technology computer.

And to think that the 68000 was the first processor considered for the first IBM/PC, but for compatibility reasons (with mainframe technology) they chose the i8088 instead. Pity...

Regards,

Clockmeister.

On 30 May 1999 04:24:16 , having realized why he was getting those, er, special feelings towards Tinky Winky, The iDiot Forever Known As Sinclap wrote:

>'Chunks' absence has created wild speculation that he has a girlfirend,
>or has a new real money job that involves working a obscene schedule
>like myself or he realizes that iMac have really sold well up north.

and the above post shows that TiFKAS is still hallucinating and needs to go to Bellevue to continue the shock treatment, because:

1) his imaginary friend "Chunks" - who he calls up whenever he is losing an argument - doesn't exist.

2) the iMac has not been as big a success as he claims, judging by the PC Data report this month that showed that iMac sales actually slowed down significantly in April (the month his favorite source, The Daily Tubby, swore up and down that iMacs were "hard to find anywhere") Indeed, it mentioned that it was still possible to buy a brand-new 233mHZ Rev. B iMac at many dealers in the US! Looks like the Steve Jobs Reality-Distortion Field® is beginning to belch smoke again....

3) He still insists that Final Cut will take the place of the recently departed Avid, despite the fact that a professional video user in .advocacy reduced him to chutney and revealed that TiFKAS doesn't know beans about producing video.

Now if he had only directed the above missive at me, rather than his imaginary friend, he'll have found that #2 - having the new job that paid significantly more and at an obscene schedule - would have been correct. And am enjoying a nice big video screen as part of the fruits of my labour on my Falcon, which, BTW, didn't require any "hack n' slash" to install....

>--
>"Although there are more Microsoft Windows users
>than Macintosh users, we would like to remind you
>that there are far more cockroaches than people."

now I could set up a line saying that all Macintosh people are cockroaches, but I know Mac people better than that - the only one who could fit that job description is TiFKAS.

Would LOVE to see a cage match between TiFKAS and the equally brainless Mac-baiting PC-user Ho You Kong from mac.advocacy - they're equally matched for lack of intelligence and their ability to prove with their trolls that there is such a thing as negative IQ....

but there is Bellevue Mental Hospital in New York, which last I heard also takes patients from out of state. Your upcoming stay there, BTW, may not be as pleasant, as there was a news story out that they're taking out all their Macs and replacing them with NT boxes....

>And speaking of Jesse,
>can't you folks up north get it right that if you do a Ventura movie
>that it's done accurately....

up here in Canada Jesse Ventura is seen as a joke and as a crybaby who pouts when he doesn't get his way (very much the same way TiFKAS acts in .advocacy). He has an ongoing invitation to debate our provincial fisheries minister on why Missourians aren't allowed to take more than their regulated share of their fish over the border, and yet he has refused: could it be the fact that, like his former profession, he falls flat on his face if he doesn't have everything he does scripted?

You can keep your whining crybabies like Ventura, we have the Hart family up here (whose own documentary movie, also Canadian made, has been winning rave reviews on exposing the ridiculous spectacle pro wrestling has become).

>the iMac is #1!

well well, it looks like TiFKAS has fallen in to the same parrot-sheep line that Steve Jobs requires all his mindless minions to squawk and bleat whenever damage control has to be done.

Using that same line of reasoning, let's add up all the Compaq Presario models sold that month! Or, let's add up all the HP models sold that month - it doesn't matter that they all have different features, they all say HP Pavilion on them! Oh, look, the iMac got ground into powder.

Just so you're keeping score, according to PC Data the combined sales of both 266mHZ and 333mHZ YUCK iMacs in April came it at #11. In order to make it to number one, you'd have to have a lot of original, Rev. B and Rev C iMacs in stock in be at #1 - why TiFKAS, you mean THERE ARE STILL OLDER iMACS FOR SALE IN THE US? They're NOT flying off the shelves like you've been bragging for all these months? You're not trying to slip us Atarians the old rubber peach just because you're a gullible child, are you TiFKAS?

>I doubt that Rev B ones are plentiful up north...

but there appear to still be lots of Rev. Bs for sale in the US, according to the report....

incidentally, the iMac commercials began running again one week after the PC Data report came out....

> 3) He still insists that Final Cut will take the place of the recently

>show goers and the Apple folks know during the Strictly Business show in
>Minneapolis this past week which wore out sinclap...

of course TiFKAS would be tired if he had to clean out all those toilets in the convention centre like his boss told him to - with the precarious position Apple is in right now with the bottom falling out of the iMac market, heaven forbid that Steve Jobs would risk any further damage by letting TiFKAS open his mouth in the vincinity of any suckeHHHHHHcustomers.....

FCP is the beginning - the beginning of the end of the Mac video market if Jobs and the other clowns on Apple's board don't do an about-face and bring Avid back....

> Now if he had only directed the above missive at me, rather than his

> enjoying a nice big video screen as part of the fruits of my labour on my

> Falcon, which, BTW, didn't require any "hack n' slash" to install....

> What do you do now? Loading trucks in the UPS warehouse?

nope, in hardware again, and at twice the salary - and twice the store space. I'm actually working over two stores and am sent over to whichever one needs me that day. My bosses are quite pleased with my performance, how I handle customers, and how I'm often able to trouble-shoot problems, and they have both commented to me on how much they're surprised to find someone who actually enjoys the business as I do.

And it appears that once again TiFKAS has shown his utter hatred of those who work in the labouring field - of course, the pinhead has once again conveniently forgotten that labourers are an important part of a thriving economy, and since they also buy things like computers they provide the ingrate's salary. Of course, TiFKAS will once again deny that that was what he meant, but I'm sure that if he was man enough to say this in front of a UPS worker in the same tone of sarcasm, well I think that much hilarity will ensue..

BTW, I understand that UPS workers actually do make a nice living wage.

> >--

>Lets see...On day one I humbly recall that the Jagflop will fail due to
>market and Tramiels past screw ups...The list goes on...My batting
>average is high..

come off it, TiFKAS - anyone with even the cognitive powers of peat moss could have seen that coming. Let's face it, the Tramiels were so inept at promotion they couldn't even market immortality.

hmm, this coming from the same guy who said that Apple's leadership under Gil Amelio had "cleaned up the mess" from the previous administration right before they posted a $1 billion loss (and in the same breath called Steve Jobs an "arrogant bonehead" who would destroy Apple if he ever came back to power, but when Jobs DID come back TiFKAS suddenly developed a taste for shoe polish)- who said that "90% of all TOS applications fall over on the Milan" before it was even launched (and it has proven to be not only very compatible, but a surprise hit in Europe), who said that Sony and Connectix would sign a licensing deal for VGS (and instead wound up in a lawsuit, with Sony winning the first round by getting a court injunction against Connectix preventing them from selling VGS), who claimed that TAF was on its last legs and would have its entire executive voted out of office just because we were able to lower the membership fees (we were all voted back in by acclimation just two weeks ago), who brayed loud and long about how Pointcast would render Atari net use obsolete (and was yet pointed to as "Internet Flop of the Year" by a number of respected periodicals - shall we go on, or should we shelter TiFKAS' already cracking ego any further strain

>

>I guess the election did not go your way...

actually it did - I won my position by acclimation, as did Ken, our president. Why spoil a good thing? :)

BTW, we need your cranial dimensions, as we're busy designing your trophy for your new enviable position of "A*****e Of The Year" - we finally found someone who could mold a set of rubber buttocks and we want to ensure that your head fits comfortably....

>Sent via Deja.com http://www.deja.com/
>Share what you know. Learn what you don't.

what did we learn from TiFKAS this time? This is what we expect from years of Sinclair in-breeding.

What did TiFKAS learn from posting using Deja? Mommy make cake. Cake good.

It would make a great episode on the claymation wrestling program (non) Celebrity Deathmatch! Not that we know (or need to) what these dung-flingers look like! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The hardware/lawn business? Twice the salary does not indicate if it's
twice the minimun wage which would still be dreadfull unless you have
kids to support..

But you all were in denial if I recall. The chant was this is it...the
Tramiels has scored a home run...Don't denie it...

> hmm, this coming from the same guy who said that Apple's leadership under
> Gil Amelio had "cleaned up the mess" from the previous administration right
> before they posted a $1 billion loss (and in the same breath called

Amelio was in the right direction with the financial controls but wrong
in the product category. Amelio and CFO Anderson set in motion the
restructuring. It was Jobs who initiated the iMac project a day after
he returned.

The $1 Billion loss was mostly a inventory write down...Not a lost from
operations. The Actual loss was below $200 million...

Apple's cash at the time was tied in $2-3 billion in unsold inventory.
Amelio lowered the value to write off to sell inventory to create cash..

Under Jobs and Anderson, Apple ends the the quarter with under $20
million or a days worth...Thats how they create $200 million plus cash
per quarter and sitting on $2.9 billion in cash up from $500 million
when Amelio took over..

Steve Jobs
> an "arrogant bonehead" who would destroy Apple if he ever came back to power,

Source record: 3275

Uh huh.. let's first analyze your numbers, especially 20% of the price.

You can easily get an AVID SYSTEM for around $25k now, including CPU, drives, everything you need.. turnkey.

For video editing on a G3 B&W, you need the most horsepower possible, which means 400mhz, tons of RAM, SCSI
RAID, etc. That just cost me $6k (18 gigs HD space, 256 megs RAM). I didn't get 2 monitors and a 2nd video
card for this price, but let's just say this includes it just to be charitible.. plus prices probably have come
down a bit. Now, you will still need software. FCP is $1g. Also, you need the advanced driver kit put out by
a 3rd party, as Apple's drivers don't support simultaneous input and output amonb other things.. $500. Oh,
you're a semi professional, and some of your video is on a pro format (Beta SP) and not DV (or even Hi8 or
SVHS)? You need an analog (component) to digital (firewire) converter for your Mac to get your video in..
otherwise, you're hosed. That's another $1g. What, you want to use time code on your hi8 or SVHS system?
Sorry.. only supported with DV, not any analog formats, so you can't batch digitize. Oh, sorry, you can't bring
in your audio from a DAT via SPDIF.. it doesn't exist on this system unless you add another $350 for another
card. Oh, how many card slots are left? Hmm.. wait a minute, I have a SCSI controller, 2nd monitor card, and
adding the audio card will leave me.. with none. No slots left for an MPEG decoder card.

OK, let's do the math now:

Turnkey AVID system: $25k
B&W G3 system: $6k+1k+1.5k+500+350= let's just call it $9k.

That puts the G3 based system at right around (over, actually) 1/3 the cost. Much different then 20% of the
cost, isn't it? Don't get me wrong.. the B&W G3 system is great, I own one.

But it's just not as reliable or professional.. anyone who says so is proving they don't know what they're
talking about.

3813. TAF Meeting June 16th - Mario Becroft's Marvels

Newsgroup: comp.sys.atari.advocacy
Date: 1999-06-07 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <375bee96@nemo.idirect.com>
Source record: 3276

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

3814. TAF/TPUG Joint Flea Market June 19th in Toronto

Newsgroup: comp.sys.atari.advocacy
Date: 1999-06-07 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <375bef03@nemo.idirect.com>
Source record: 3277

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. 3817. G3's unreliable?

Newsgroup: comp.sys.atari.advocacy
Date: 1999-06-10 00:00:00 UTC
From: mgrove@iwvisxp.com
Message-ID: <928989995.903.42@news.remarQ.com>
Source record: 3280

While some users have found a loop hole in NAVAIRS order to purchase only new PC machines, it seems that the ones that have choose to do this have found that a large shippment of G3's to the NAWCWDPS have defective video cards. In our group alone, 3 of 10 had to be returned. More returns were reported at division levels.

So much for Apple quality control.....

Mikey

Sorry Sinplop. This is no BS. I could provide proof, but you would be
the only person to refute it. Besides, it's only the government and
it's easy for companies like Apple to screw them.

What would you consider proof? A scanned copy of the returned
authorization from Apple? Dealer repair recipts? Of course these would
be forged, right?

Fuck you ass hole. When confronted with the truth, you only slither
further in your hole.

Avid, today just announced price cuts by upto one 26%.

If you look closely, only 50,000 folks own such a beast...A G3 with FCP
will exceed that number with one hand tied in the back..Looks like FCP
has Avid worried..

However, a certain chunky and salad character would say
otherwise...Looks like the dressing is causing saginess....

Avid Xpress is part of Avid's award-winning family of video editing
products and offers both
compatibility with an upgrade path to the company's
flagship Media Composer system. Avid Xpress
features the Avid editing interface, the professional
choice of over 50,000 trained editors worldwide.

Avid Xpress for the Mac G3 is offered as integrated
software and hardware kits (G3 CPU available
separately). The US MSRP for new kit prices are as
follows:

The Base bundle has been reduced by 6% to $9,999

The Plus bundle has been reduced by 22% to $12,999

The Deluxe bundle has been reduced by 19% to
$19,999

The Elite bundle has been reduced by 26% to
$29,999.

That's funny, the people were stupid and that was a trait microsoft exploited. Therefore the people are cockroaches yet the cockroaches are people.

In other words, so what? We're all life forms.

3823. TAF/TPUG Flea Market June 19th

Newsgroup: comp.sys.atari.advocacy
Date: 1999-06-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3765ad53@nemo.idirect.com>
Source record: 3286

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

3824. TAF Meeting June 16th - Mario's Marvels

Newsgroup: comp.sys.atari.advocacy
Date: 1999-06-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3765adcc@nemo.idirect.com>
Source record: 3287

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Looks like a certain person will upchuck 'chunks' of food solids in his split pea soup... Now he will swear that this came from a loony right wing rag...

School update 2: Toronto schools, more
by Dennis Sellers, dsellers@maccentral.com
June 16, 1999, 3:30 pm ET

The Toronto Board of Education has made a huge commitment to the Mac platform, possibly to the tune of 10,000 iMacs for Toronto schools, according to Don Nicklin, assistant director, Recording Arts Canada.

Nicklin said this info came from an Apple rep who demoed some new Macs at a User Group meeting last week in Hamilton.

Michelle Fleitz' husband is a PhD student in Computational Sciences at George Mason University in Fairfax, VA, which has a well-supported Mac community. If you go to their college bookstore, you can get pretty much any Mac software at the academic price right on the spot, says Fleitz.

"They are VERY well-stocked for their art and visual media departments," she adds. "Also, I work at American University in Washington DC which has a great Mac community. Although the bookstore here is lacking in both PC and Mac software, Macs are well-supported between the publications department to their new media labs to the communications department and even the law school. It is a very Mac-friendly university."

Thats nothing...try outfitting an entire country of primary schools with net ready PC's...that happened here in NZ some time back.

Also, I'm getting sick of seeing iMacs on NZ TV screens...I was wondering why it was occuring...turns out Apple are the ones providing 'motivation' to local TV producers for maybe a few iMac appearances on national TV...

Aren't they just turning into a Micro$loth clone now huh?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I bought a G3 in December (not the new 'fancy' colured one) and
equipped it with an internal Zip - I am now on my 3rd Zip drive, it
has failed again, and my 4th 'motherboard' - Apple Canada are now
'thinkin' about replacing this large yellow ovoid filled with sour
fruit !!!

Meanwhile my old Mega/STE keeps on, keeping on !!!

Progress huh ????

->compared to outfitting New Zealand's primary schools with net-ready PCs.

I think we should take that one step further, to be completely honest. It
was already stated that 10,000 Macs were being bought. The population of
Toronto is irrelevant, as is the population of NZ. What is pertinent is
the number it took for the primary schools in NZ. Once you have that, a
much fairer comparison can be made... ;-)

I can't really see why an Amiga user would want a PC mouse with an adapter which performs doubleclicks with the middle button, when there are three-buttoned Amiga mice which supply a real middle-button signal, which has functions of its own on the Amiga, rather than just supplying a double-click.

This VGA adapter and IDE interface seem very interesting, though. Combined with a 4 MB expansion, they'd make my ST seem like a really reasonable little machine.

I wonder if these gadgets'd show up on NAS.

as an update - TiFKAS never showed up at the Flea Market. I think it might
have to do with Ontario's rigid control over letting rabid animals across the
border, and they spotted him foaming at the mouth.....

the key word here is convenience in finding a replacement mouse at a reasonable price - Mario heard that Amigans were having problems finding mice, so he added the option to allow for Amiga use (it's dip switch #4). Ken has already sold one mouse adaptor to an Amiga user here in Toronto who was in desperate need of a mouse, and we got some interest at the Flea Market from a few others.

BTW, I'm using a Mouse Adaptor right now with my Falcon and a Logitech 3-button serial mouse - that middle double click has come in handy. And Chris, our PHOENIX editor, is using a GlidePoint pad on his STe, as he finds its much more comfortable. You could also use a drawing tablet with it as well, or with one of the many PC trackballs.

>
>This VGA adapter and IDE interface seem very interesting, though. Combined

The VGA adapter has turned out to be the surprise hit of the entire range of products being made by Mario - according to Ken he's sold quite a few of them, including a number of US users. The IDE adaptor is a great feat of engineering, because not only is it a hard drive adaptor it's also a TOS upgrade (2.06). The STe version is also neat because it actually requires just one solder point, it plugs in over the original TOS chip.

>
>I wonder if these gadgets'd show up on NAS.

I think if there's a Scandanavian dealer it would be bound to show up. And
wait till you see what Mario has coming next :)

Oh well, I suppose the situation could be different if you live on New Zeeland
or Canada. Perhaps could Mario set the third button to be a "pure" middle
button in Amiga mode?

> BTW, I'm using a Mouse Adaptor right now with my Falcon and a Logitech

>well, or with one of the many PC trackballs.

Drawing tablets, that sounds like a good idea, since I don't think Tabby is
manufactured any more, although the Amiga supports Wacom tablets.

>>This VGA adapter and IDE interface seem very interesting, though. Combined

It's a pity I have a vanilla STM, but it sounds like quite a feat, especially
coming from a private person!

>>I wonder if these gadgets'd show up on NAS.

> I think if there's a Scandanavian dealer it would be bound to show up.
> And
>wait till you see what Mario has coming next :)

That would help a lot, since it sounds like a chore to order from overseas. I
don't suppose one could build these kits by hand?

Many many thousands of primary schools. Much of New Zealand is small rural centres with schools catering for as few as 10 or 20 pupils...that adds to a very high number of schools considering the population base...

There is only one main centre (Auckland) with more than 500,000 people. I live in Christchurch with about 350,000. Wellington is next with around 300,000. Nothing else is bigger than 100,000. Towns with less than 20,000 make it into the top 10...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

well, Ken is expecting sometime this week the beta of Mario's new keyboard/mouse adaptor that
will allow for attaching a PC keyboard as well as a serial mouse, so no more
mushy keyboards. :)

As well, he's working on a 68030 accelerator board for the ST, and a series
of new graphics boards for expanded resolution and colour - first for the TT
and MegaSTe, next for the Falcon, and then one for the ST.

There's just no repressing that kid :)

and the fact remains, TiFKAS, that you not only don't know beans about how the video market operates and works, but it's well known the fact you have all the intelligence and personality of a cheese omelette. Particle Salad has done a GREAT job exposing your profound ignorance on the subject.

Besides, what would you prefer to use - the rock-solid operation of a package that is known as an industry standard like Avid is, or a sub-par kludge that has a tendency to self-destruct in the middle of a project like Final Cut (that was recently reported on the Macintouch web site at http://www.macintouch.com)

And speaking of which, for someone who's supposed to be such a hot-shot "Apple Power Rep", howcome some of the biggest complaints about the laughable

disaster that the Sears launch of the iMac has become seem to be centred at
stores in the Minneapolis area, which I believe happens to be in your territory?
(http://www.macintouch.com/imacsears.html)

Ready to surrender, TiFKAS?

Lets see...A G3/400 with 128MB, 12 G's plus a Apple 21 screen, a copy of
FCP and DV camera will set you back $6 G's...

Do the math...80& of an Avid system for 20% of the cost.

why don't you GET a clue, TiFKAS? I see you're dodging the issue as usual. To repeat - Particle Salad is a professional video person familiar with Avid on the Macintosh who knows what he is talking about, while you? A shmuck of the highest order who keeps tilting at windmills with fujis on them while wiggling his prodigious ears in order to try to distract people from the fact he has absolutely no idea what he is talking about...

>

coming from someone who has proven time and again he can't even add, much less multiply. Again, Particle Salad had proven you wrong. And TiFKAS, instead of facing the facts, keeps on bleating the same old parrot-sheep lines his Uberboss Steve Jobs feeds him...

and again, dodging the issue - what use does a professional need with a kludge like Final Cut when it keeps on self-destructing in the middle of the project? Even Apple is admitting they goofed. Go back and read the article again...

>
>> And speaking of which, for someone who's supposed to be such a hot-shot

>flies...Nice try..

try "bullseye". I suggest you read the Macintouch web page (a web page that
is honest with Mac users about the issues about the product and not prone to
kissing Jobs' ass like certain "Apple Power Reps" with no life) and see just
what is going on - bad placement, little stock or peripherals, $100 over the
MSRP, bad-mouthing by Sears salesmen, paltry incentive to "spiff" as compared to
PCs - yep, it looks like the Best Buy fiasco all over again...

But it looks like Apple is on the right track that they've decided to get
replacement workers to fix the mess, you probably would have screwed it up even
worse...

again, TiFKAS - ready to surrender?

There doesn't seem to be! I just hope his projects are financially viable, as it is one thing to have innovative ideas but another to be able to get them on the market without asking an arm or leg for the 'priviledge' of buying stuff. Also the New Zealand dollar is a pile of crap (in ForEx terms at least!). We used to get 0.41 UK Pounds per NZD...now we get 0.32...all this in a 2 year period. The price of UK software hasn't moved much so that means a massive increase in the cost of buying software for we Kiwis...that ultimately would also affect production costs and exporting OUT of NZ detrimentally...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A good 3 chip DV camcorder ALONE costs $4g.. and you need a deck if you don't want wear and tear on your camcorder, another $4g.. 128megs RAM isn't enough, 12 gigs isn't anywhere NEAR enough, a single monitor is almost ridiculous for this type of work.

Of course, you wouldn't know that because you've never done it!!

We already DID the math, Einstein.. and guess what? Your figures are wrong as usual. Remember my post outlining the costs? dejanews, if you don't..

Keep talking.. you keep making yourself look MORE and MORE like the internet MacWacko stooge.

Good work as usual, PS.

Of course, I predict that TiFKAS will ignore what you're saying and keep on wibbling on about how Final Cut will be the be-all and end-all for video production, despite the fact that he's such a cheesehead he couldn't even use a disposable Fuji camera without hurting himself.

Honestly, I think TiFKAS is actually, unknowing to himself, trapped INSIDE the Steve Jobs Reality-Distortion Field&#65533; and is slowly running out of oxygen as the methane levels rise inside, thus his constant hallucinating about things as he sees fit as opposed to the truth...

BTW, TiFKAS - a report on Macintouch recently reported a CompUSA recently selling a brand-new original release iMac for $600 US. I thought InCompUSA was supposed to have flushed those out of the channel months ago...

Done what? I have used FCP and had access to the above eqipment above.
You are missing the point here. The DIGITAL editing tools centered
around FCP and the G3 B/W has opened up a new market for Apple. Folks
can start out small and improve the tools as time goes. Not all have
$25,000 and up capital to start with.

FCP will become 2.0 and beyond, while DV equipment will prolipherate and
prices will fall. As past history is any indication. Remember the
early history of desktop publishing?

I never stated that FCP is the be-all and end-all. FC will open the
market with amateurs entering the fold to become pros in the future.

Time to take a time out on the Sompsons and South Park..

BZZT - WRONG! You have been constantly bragged about how FC is supposedly posing a threat to Avid to force them to drop their prices. Avid is a professional software compnay. Are you once again in denial - or are you once again trying to rewrite your own history.

I repeat - Particle Salad is a PROFESSIONAL who KNOWS what he is talking about. TiFKAS is a known CHEESEHEAD who knows next to NOTHING about the video industry...
>
>Time to take a time out on the Sompsons and South Park.

You know, everytime TiFKAS posts, does one hear the voice of Cartman whining for his Cheezy Poofs?

BTW, it's The Simpsons. TiFKAS is still upset that the ingenious Matt Groening slighted Apple in one of their classic episodes (""WHAT computers?")

it's "envious" and "success". Still can't spell, can we - or has Apple's requirements for employment dropped?

And why would I be envious of someone whose failures are now coming to light, especially now of the news of the P1 notebook being significantly delayed or even being cancelled because of the problems they've uncovered (including the notebooks catching on fire), and because of criticism that they've been unable to supply Powerbooks to their dealers while they seemed to

have plenty to sell at the Apple Online Store? And who has been confirmed by the recent telefilm to be much a crybaby and bully much like yourself when he/you can't get your way?

Gee, that's enlightening.. if not completely obvious! I never argued with this.

> FCP will become 2.0 and beyond, while DV equipment will prolipherate and

Again, I didn't argue with this either..

> Feeling the competitve threat to your livehood?

You are a moron. I don't CARE what tool, platform, software package, whatever that helps me get work done. MORE choice is a good thing for me (not for you, because you're a simplistic apple stooge).

When FCP becomes ready for prime time, I'll be HAPPY to use it daily. BUT the problem is, YOU are the gentleman who likened it to an AVID and said AVID is "scared." This only proves you are clueless..

Moron.. where's the "threat?" I'm GLAD FCP exists, and will buy it and use it when it's ready. It will help me eliminate Premiere from my video arsenal.. but it won't make me sell my AVID anytime soon.

Not everyone is a simpleton "evangelist" who actually care what platform/tool they use to get work done. You see, MacWacko, most of us use whichever platform/tool WORKS BEST. When FCP works best, I'll use it.

I've rarely read the postings of such an obvious, unabashed simpleton on the internet before. Congratulations.. you've reached a new low!

Ain't that a bummer! Fancy not supporting low density Mac disks and yet
supporting low density DOS disks!!! Is the iMac really a Mac??!! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

once again in denial, I see. We're talking about the software, not hardware
here.

And once again trying to dodge the issue of the problems reported regarding
FCP. Nobody's going to trust Apple on the next revision if they can't fix what
is proving to be such an embarrassing flaw that should've been caught before it
even left the lab. Even Apple is admitting they goofed...

nope, try this:

http://www.msnbc.com/news/282445.asp

this is where I found the original news story to begin with, complete with sources from within Apple and from the well-respected web site PowerBook Central. They said the Titanic was leak proof as well, did they not? :)

and of course our paranoid little friend TiFKAS will claim that it's all a big conspiracy by vested interests to try to smear Apple - when in reality it's TiFKAS getting smeared all over the information superhighway by the truth. Just like his inability to prove his charges that any PC debunking of how Apple cooked the G3 speed tests were also a similar conspiracy, or his denial that he was sucked in by a story from the totally unreliable Daily Tubby that you couldn't find coloured iMacs anywhere in Canada in the month of April when it was obvious Conrad Black's reporters (and also the Montreal Gazette's) didn't do their homework and follow up on what was basically puffery from the Apple Warehouse, which this self-style "Atari Boob" was able to debunk just by making a few strategic visits and phone calls...

>
>So you have to buy an extra....
>
no, you buy the best machine for the combined job - and as John Carmack said, it ain't the Mac at this time...

"The lunatic is the man who lives in a small world but thinks it is a large one; he is the man who lives in a tenth of the truth, and thinks it is the whole. The madman cannot conceive any cosmos outside a certain tale or conspiracy or vision. Hence the more clearly we see the world divided into Saxons and non-Saxons, into our splendid selves and the rest, the more certain we may be that we are slowly and quietly going mad. The more plain and satisfying our state appears, the more we may know that we are living in an unreal world. For the real world is not satisfying. The more clear become the colours and facts of

Anglo-Saxon superiority, the more surely we may know we are in a dream."

-G. K. Chesterton (1874-1936), British author. And a better description of how TiFKAS operates I couldn't have said myself.

Man, you know even LESS about the subject then I EVER imagined.

Peter.. TIFKAS.. MacWacko.. let me explain it in small words for you. As tools get cheaper, people STILL need to know how to light, shoot, edit, etc. The whole paradigm has already happened in the audio world, and guess what? The big studios haven't gone out of business!! Why? Because people don't know how to mic a drum kit without years of practice.. and also because, as good as small personal recording studios have gotten, they STILL lack the expensive
quality outboard processing of the major studios, and most people cannot get that sound at home
unless they are experienced.

Not to mention that, as I've said before, there's no threat to my personal livelyhood because I
work in house for a software company.. we already OWN an AVID. My in house clients don't care
what tool I use, and neither do I as long as it works right.

Think Again!

3:28 PM]
Wall Street Joins The Apple Products Rumor
Game
Reuters is reporting that Salomon Smith
Barney have issued a statement saying they believe the P1 is on track
for being introduced this July at
MacWorld. According to the Reuters report:

Salomon Smith Barney analyst
issued a report saying he believes that Apple's new consumer
portable computer is on track for
launch at MacWorld next month.

In the past week, some reports on
the Internet have surfaced speculating that Apple is having
production problems with the
much-anticipated consumer portable and that it could be delayed.
One report, on MSNBC.com last
week, went as far as to say that Apple was even considering
scrapping the project.

"There were reports last week
that Apple's new consumer portable might be delayed," said
Richard Gardner, a Salomon Smith
Barney analyst, in a report to clients. "We believe the new
product is on track for a July 21
introduction."

Apple officials in Cupertino,
Calif. declined to comment on any details of unannounced
products, nor will they confirm
analysts' speculation that the rumored product will be launched
at MacWorld in New York on July
21, where interim chief executive Steve Jobs is due to give a
keynote address.

"We announced it awhile ago,
saying we would announce it in 1999," said Natalie Welch, an
Apple spokeswoman.
"Unfortunately, we are not announcing anything further. We said we
would release it in 1999 and we
are on track."

There is more in the Reuter's report
that is worth reading and, as always, we encourage you to do so.

The Mac Observer Spin: This is very
interesting. Apple is notoriously tightlipped when it comes to
advance product information. This is
certainly more so the case with Steve Jobs at the helm. One of the first
things he did upon assuming the throne
at Apple was seal all the numerous leaks that were saturating the
Internet.
Ms. Welch's statements quoted in the
Reuters report is actually much more informative than normal. Rather
than
saying we just don't comment Mr.
Gardner, she confirmed that the P1 is on track. Whether that is true or
not is
another matter, but we believe it to be
the case.

Richard Gardner is perhaps the most
Bullish Wall Street analyst on Wall Street, but it is still a bit
unusual to see
Wall Street leap into the Rumor Game.
As Mac users on the web know, nothing piques the interest of Mac users
more than a juicy Apple tidbit, but the
Wall Street Boys and Girls are more interested in seeing information
affect
the stock market. In today's case, the
effect was a big jump in Apple stock. We will cover that in the Apple
Stock
Watch report shortly.

Interesting.. not only are you a MacWacko "evengelist" blinded by religious fervor like some wacko
holy terrorist (as if a stupid COMPUTER is worth being so passionate about), you pick someone who
uses Macs daily in audio and video production to hash this out with.

Only an idiot allows the marketing hype to blind him to the obvious facts.. the Mac, like the PC,
your car, your toaster, or your toilet, is just a TOOL. They each help you get things done. When
they start getting in the way, you get a new one, whichever one works best at helping you get
things done.

That's the way most people feel, anyway.

TIFKAS, the MacWacko extremest "evengelist" thinks different(ly). He doesn't have any work to get
done, except to SELL the tools. He has to hype his little tool, because in doing so he feels
validated, it makes his life somehow meaningful, it makes him feel superior. Unfortunately, like
many people, it will take him some time to realize the futility of it all.. like the money
grubbing baby boomers of the 80's discovered, someday he will finally see that all his MacWacko
rantings and hype-parroting have not made him a better person.. have not helped him contribute to
society.. have not helped him develop.. have not helped him learn about himself.. and have not
helped him CREATE.

Then, and only then, will he search out the bigger truth and not waste all his precious time
trying to prove that his tool is somehow better then all of the others.. only then will he
discover that those who are CREATING don't CARE what tool they use.

The creation is the important part, NOT the tool.

-Mark

PS.. I apologize to the Atarians here who actually enjoy debating the MacWacko.. sometimes I just
get so tired of the idiocy.

On 30 Jun 1999 16:24:05 , having cursed himself at not putting his Depends on before he read the news about the new Atari-badged Milan coming to the US in April 2000, The Idiot Forever Known As Sinclap wrote:

>> once again in denial, I see. We're talking about the software, not hardware
>> here.
>
>That the beauty is..It's in the software stupid!

yep, and it's in the software that FCP fails at being the Avid killer you were claiming it (and now denying you ever said) to be...

>
>> And once again trying to dodge the issue of the problems reported regarding
>> FCP. Nobody's going to trust Apple on the next revision if they can't fix what
>> is proving to be such an embarrassing flaw that should've been caught before it
>> even left the lab. Even Apple is admitting they goofed...
>
>Whats the embarrassing flaw? Who is not going to trust Apple? Or is
>this the Atari Jihad view..?

nope, not according to the devoid-of-imaginary-Atari-Jihads Macintouch, which for some reason you seem too scared to read. FCP has been getting complaints from their users about it actually self-destructing in the middle of projects. Apple is admitting there's a flaw...

>Anybody can claim to be a professional just like yourself...Your a Atari
>Jihad Veep prof that has no ambition for the top...-)

Now this speaks volumes of just how dense you actually are, TiFKAS.

Firstly, there is no shame in being Vice-President of a computer club. Everyone who finds out about my position finds it to be infinitely cool and a badge of showing my amount of commitment and intelligence. Of all the people who have commented on my being Vice-President of TAF, yours is the only negative one - and, to me, is nothing more than flatulence in the wind like all of your so-called "pronouncements" about the state of Atari, which we have all come to accept as the wibblings of a punch-drunk little loser who's unable to make friends in the real world, and who is unable to admit defeat when so many have shot down your pathetic little attempts of embiggening himself...

Secondly, the fact that I was able to find myself a nice new job that is paying me more than the last one (and I was getting above minimum wage and benefits) shows how much ambition I have. BTW, people who have "No drive and no ambition" don't do wild wacked out things like jamming with a professional rock musician like I did last week at a guitar clinic with ex-Mr. Big guitarist Paul

Gilbert (BTW, I'll be posting up a picture of me with Mr. Gilbert when I get it from a friend of mine, and the URL of where you can find it)

Thirdly, Particle Salad has constantly showed his expertise and knowledge and issues regarding video production and the business in general, while you just respond over and over and over with the same old parrot-sheep lines about how FCP is making Avid "scared" with no evidence whatsoever. Perhaps it's your resentment of the fact that PS has once again made you look like the world's biggest "kook" that you, in insane jealousy, are trying (and I emphasize "trying") to denigrate him by claiming he's faking his claims. Well we, in this camp at least, believe he's for real - and I and other members of TAF are enjoying his debunkings of your drivel and kicking your little butt all over cyberspace...

Fourthly, you're right - anyone can claim to be whatever he wants on the Internet. Which comes to YOU. Several of us, both in discussion on IRC and in person, are beginning to suspect that, due to your constant idiocy and spelling mistakes and huge gaffes over even Apple-related stuff, that you are actually bluffing about your even being an "Apple Power Rep". I believe that when someone here asked for evidence of your actual employment by asking you to post to him in e-mail your supervisor's number to confirm you were actually employed by anyone related to Apple, you chickened out and complained loudly that doing so would open opportunities for the imaginary "Atari Jihads" to harass your boss.

For all we know, you could well be living in your mother's basement in Indiana, posting your drivel from a Commodore 64 that you've set up to access deja from your Earthlink account as well as getting e-mail from the Apple E-mail news service for your steaming piles of drivel. That might also explain why you're afraid to have the cojones or the backbone to post any of your "Apple Good News" to the comp.sys.mac.advocacy or comp.sys.pc.advocacy forums, because the thought of getting burned beyond recognition by the more knowledgable professional people in these forums (many of whom also use Avid) has you all scared.

An interesting example of this phenomenon is Roger Sheppard, your old flaming companion on comp.sys.atari.st who claimed that he was an older technician who had an all-powerful PC and was on a mission to convert us "useless teenagers on the dole" to throw our Ataris in the trash. It turns out, after Mr. Sheephead had (through no small effort on my and a few others' part) gotten turfed from the New Zealand Freenet for his unfortunate tendency to make racist remarks, that someone from NZ filled me in on the discovery that Mr. Sheppard was a punk kid who didn't even own a PC, but was accessing government kiosks in shopping malls and libraries to post his own brand of drivel.

Now's the time to walk it like you talk it, TiFKAS. PROVE you are what you claim you are - and NO excuses.

>> > >>
>> >> >Are you envy of Job's sucess?
>> >>
>> >> it's "envious" and "success". Still can't spell, can we - or has Apple's
>> >> requirements for employment dropped?

Who is stupid? Not the software..

It's in the LACK of hardware.. lack of component video i/o and lack of balanced audio i/o that make FCP a solution for amateurs and low level pros who ONLY shoot and edit a DV varient.

Of course, you wouldn't know that..

> Whats the embarrassing flaw? Who is not going to trust Apple? Or is

> government kiosks in shopping malls and libraries to post his own brand of drivel.

Roger Sheppard was an argumentative troll at times, but I don't think all the
story lines up. To start with the internet access in this country is very very
costly compared to the rest of the world, net kiosks are only just beginning to
appear in shopping malls (rate is NZ$2 per 10 minutes), and access through a
library is of similar cost.

If Roger Sheppard was a 'punk kid' then it is unlikely he would have been able to
afford to post the number of messages he once used to. Also, the services that
he is said to have used did not exist 2-3 years ago, which is about how long
it has
been since I have seen him post anything into comp.sys.atari.advocacy...

One thing is unanimous: Roger Sheppard and Peter Sinclair-Day remain the two most
uninformed, cretinous knockers of the Atari platform to have ever breathed the air
on this planet. But I'd be happy for them to keep doing what they do because every
day is not complete for me without having a good laugh at the ignorance of others!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

So what am I scared of? Can you actually post an intelligent response?

I have experience and knowledge in the industries I work in. Joe Shmoe with FCP is no threat to me, until he spends several years learning how to shoot, light, mic, process, edit, etc.. and even then, once he does all that, he's STILL no threat to me because I work for a company doing in-house work.. no competition. They quite like what I do..

> Such fantasy...I thought your new above minimun wage job keeps you

How do you "accelerate" a market? You don't even understand basic econonomics.

So I'll pretend I understand what you MEANT.. that is, putting it simply, that FCP is bringing desktop video technology to those who haven't had it before ("not everyone has $25k").

FCP is a very SMALL step in the desktop video evolution. The price and performance of hard drives, the creation of the DV format and low cost high quality camcorders and decks, and the increasing speed of computers in general has FAR more do to with the increasing use of computers for desktop video. To say that a simple piece of $1k software is more responsible then years of technological innovation is.. silly, even judged amoung your other, MacWacko, TIFKAS, MacParrot standard. Premiere was FAR more responsible for getting video on the desktop then FCP.. no question.

To say that FCP is somehow had ANY affect beyond a MINUTE amount is displaying, once again, your extreme lack of knowledge of desktop video hardware. A Targa card is VERY inexpensive.. and people who couldn't afford AVIDs have used them for years. Now, if they've switched to DV shooting, FCP and a B&W is a vaible switch for them.. and an increase in performance.. although, thanks to Apple's blunders (lack of 6 slot machines for quite some time), some of them have switched to Windows NT based systems (who may or may not switch back.. they can get a DV i/o card for $600)..

How many people do YOU know, who haven't worked in desktop video, would pony up well upwards of $6k just to do so? The pros won't, because they need PROVEN technology (which I'm sure FCP will be in a year or two.. but not now). As you've pointed out, AVIDs have come down in price.. why buy unproven technology? The wedding guys MIGHT, if they've changed over to shooting in DV.. if they haven't, it's pointless for them.

If you had any knowledge of the industry, you could do more then just parrot the apple press releases. Can you discuss any of this intelligently? So far, no..

Don't simply be a MacWacko, MacParrot, "evangelist," TIFKAS. Think for yourself and do your own reasoning. It's not that hard, trust me.

okay, so obviously there have been some crossed wires there or something
had been misunderstood. I therefore should stand corrected on what I said on
his situation. All I was going on was a letter from someone in New Zealand who
had informed me on what was then the current situation on ol' Roger.

One thing is for sure, though - I did have to write e-mail to the New
Zealand government to file a complaint on his pathological and abusive behavior
towards a number of people, including his personal vendetta againt Brian Becroft
and the racist remarks that wound up being his undoing, as that was a government
line where he was posting from. Perhaps he had access to a friend's office
computer?

yes, built by Milan GmBH. No, not badged as a Milan, but as an Atari complete with Fuji symbol (they're in negotiations with Hasbro). No, it'll be priced lower than the overpriced, underpowered, overhyped iMac - and it'll have industry standard ports, including USB. Yes, Motorola is taking a co-production hand in this new computer as well, seeing as the Milan was selling 50 computers a month since August '98 (pretty impressive for a small company making what is considered a "dead" computer). Yes, TiFKAS needs another change of underwear. No, TiFKAS is no expert on Ataris, seeing that he's still too chicken to reply to my debunking of his brain-dead slam of the Hades.

Need proof? http://bengy.atari.org/ali.htm , interview with one of the head honchos at Milan GmBH.

>Chunks wrote...

see, TiFKAS is so upset about the fact a new Atari-badged computer is coming on the market, he's begun hallucinating about his imaginary friend "Chunks", who, like his imaginary "Atari Jihads" who are "out to get him", has never existed...

Again - I was making above minimum wage in the last job. I am making TWICE
as much as I was in my current job. Do the math - or is that as bad as your
spelling?

Well rounded? Nope, you must be mistaking me for your imaginary friend
"Chunks".

Sorry, don't read Stephen King (whose name you mispelled). I prefer serious fiction like Terry Pratchett :).

TiFKAS is obviously jealous of the intelligent satirical genius that Matt Groening is that has allows him to live comfortably with his creations. It is also obvious that he hasn't seen enough episodes to know that it is more than the ka-ka-poo-poo humour that George Bush tried to make it out to be. Speaking of which, TiFKAS is as much an Atari expert as George Bush is an enviromentalist :)

OK. I never have met Roger Sheppard. It does sound as though whoever wrote that letter wasn't being entirely truthful (imaginative sounds better!). Myself I used to try and track where this mysterious Sheppard fellow posted from...I never did succeed so he must have had some form of 'borrowed' access...

I didn't realise he had been 'abusing' people by calling names! Brian certainly isn't a deserving target; I met him about 2 years ago and he was a pleasant chap who was easy to get on with, and a good musician to boot...he had a demo CD he had recorded with Cubase Audio on his Falcon which sounded very nice...

The thing is that we aren't puny!! We are strong because we can resist the call to buy Micro$loth or Macintoss that so many 'sheep' around the world have been succumbing to. I think the sheep living in abundance in the farms of New Zealand are more intelligent (and endearing!! ;^)) than your average Wintel or Muck user.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

50 Units a month...Wow....that should bring back thousands of developers
in the fold....Not! So is this new video game box will use a 68k or
PPC?

Also the "overpriced" iMac has sold pretty well thus far according to
the market research firms...

ROFLAMAO!

Let me take the load off your precious browser....

From theimac.com/

Teaching CompUSA sales staff about Apple and the Mac
6/30 - Rodney O. Lain

If you agree with everything that I say, then you're not
thinking.

--I once heard someone say this

A few weeks ago, I reported CompUSA's new initiative to educate its
sales staff on things Macintosh. Last week, I
mentioned that my boss at CompUSA asked me to help lead the Mac
classes. Well, this week we completed that
training, and I must say that I am actually becoming more optimistic
about CompUSA as a national Apple Macintosh
presence.

Here's the gist of what happened:

We had two classes -- the Tuesday night session for half of the sales
staff and Thursday night for the second half of
sales guys. The first night was more of a lecture and a hands-on with
the store's demo Macs.

Tuesday night

The Apple rep conducted the first half of the meeting. He outlined the
Mac market in the Twin Cities; I was pleasantly
surprised to find out that the Twin Cities is the fourth-largest market
for Macintosh sales, given the heavy concentration
of publishing houses and creative-content professionals. He also gave a
breakdown of the Minnesota demographics;

i.e., he described the typical Mac user.

Then it was my turn.

Maybe I'm becoming a more mature Mac bigot, but I had no urge to describe the Mac as the world's greatest computer (even though it is). My approach was more of an appeal to their logic. I explained the statistics supporting the fact that the iMac is the best-selling computer since its introduction. I gave the anecdotal example of a customer whom I had met. She said that she'd been in the store earlier that week and a sales person talked her out of buying a Mac. I told the group that that woman had bought no computer, when in fact, she had come there specifically to buy a Mac. The store lost money due to some idiot sales person's dislike of the Mac.

"Hey, I sell Packard Bells, if that is what the customer wants," I told them, "even though I hate Packard Bell computers. You should have the same approach towards the Mac. The sales person's computer preference should have no bearing on the customers needs and wants."

I stressed the fact that the Mac is no different than any other computer, in terms of sales: it has peripherals; it has software. I explained that Mac users buy a disproportionate percentage of software, peripherals, etc., considering the Mac's small market share.

I explained that the Mac OS is the #2 consumer OS in the world, a fact that people consistently overlook. I explained that the iMac single-handedly made USB an (emerging) standard.

After my presentation, the staff was shown a video on the Mac OS. After that, the Apple Rep and I led a tour of the Apple section and demonstrated the features of the iMac.

As the Apple Rep talked, I pulled aside one of the sales people and asked, "how long does it take to network two PCs?" Then I asked that he time me as I network the display iMac and my PowerBook G3. I clocked out at 2 minutes, 47 seconds. When there was a lull in conversation, I told the group what I'd just done.

"He actually did it in just 2 minutes," my "timer" noted, "it took him 47 seconds to remember his password."

Several of the sales guys asked questions afterwards and expressed more than just a passing interest in the Mac. There was actual interest.

Thursday night

On Wednesday night, I caught a brainstorm. I was playing around with my PowerBook and noticed that I had Microsoft

PowerPoint (which I'd been meaning to learn). I thought it would be a great idea to put together a slideshow presentation. So, one hour later, I'd put together something to present Thursday night. Did I mention that I'd never created a PowerPoint presentation before?

Anyway, the next night, I got to the store and set up the projector to run off my laptop. I also made sure that when the staff made in, they'd see the OpenGL screen saver that I have recently installed. That gave me a chance to make a nice segue into the fact that SGI's OpenGL API's are the standard for game development, and that it is now a part of OS 8.7 and beyond.

Thursday night's training went well, also.

The aftermath

The results of the training are pretty evident. The sales people spend more time in the Mac section nowadays. They spend time keeping the shelves stocked; there are more people involved in the Mac sales (if we could have more to sell, it would be nice, though).

I also took advantage of the situation.

One of the sales staff mentioned that it's hard to sell Macs, because many of the peripherals, software, and hardware are not in stock, even though we know they all exist. I asked our manager why CompUSA doesn't stock the peripherals that are being sold for the iMac (USB adapters, SuperDisk drives, etc.). I did that for two reasons:

1.I really wanted to know, and
2.that shows the sales staff that it isn't Apple's fault for not having inventory in stock.

A few hundred more complaints/suggestions of this sort, and we'll have Mac peripherals in the store for a change.

A side-point to all of this: on Sunday, two customers came in who turned out to be CompUSA employees. Professing to be big-time Mac users, I asked them if they have any "pull" with Jim Halpin (CompUSA's CEO), for I wanted them to pass on some complaints of mine. It turned out that they are national trainers for CompUSA' larger corporate accounts. We talked for a long time, and I noted that if CompUSA doesn't shape up that iMac sales may go to places like Sears.

Another interesting side-point to all of this is now that I know PowerPoint, I spent the weekend putting on PowerPoint presentations (when sales were slow) -- something I plan to do on a regular basis now. You see, I obtain regular

copies of the Apple Sales and Marketing Resource Library. This is a set
of three or four CDs chock full of the latest info
on Apple products (congratulations to Apple's marketing group.
Suggestion: could you make the disc a hybrid CD? You
know, for Windows and for Mac? Not all sales have Macs&#65533;). For example,
this month's CDs consist of complete
PowerPoint presentations on the PowerBook G3 Series, Final Cut Pro,
QuickTime 4.0, WebObjects "Success Stories";
also included are QuickTime movies of Worldwide Developer's Conference
speeches/sessions (the Mac OS 8/8.7
Overview, OS X Overview, for example),

The PowerPoint files are a great help. I set them to run &#65533; la a store
kiosk. I set them to loop continuously and swapped
them out regularly throughout the day. Customers were treated to
presentations on Apple products, as well as DVD
movies ("Austin Powers" and "A Bug's Life").

All in all, I think that things in our part of the world are doing
nicely. If the management in other stores put forth the
effort that we did, then the implementation of Mac training at CompUSA
will be a smashing success.

I don't know if you gentleman have noticed, but it seems the MacWacko has stopped responding to my posts directly. I'm not surprised, as he doesn't know a thing about the industry.

The most amazing thing, to me, is how someone can try and discuss something they so OBVIOUSLY know very little about. You can usually bluff yourself through it for a couple of minutes, but then it becomes increasingly clear how little you know (I know this from experience.. it's now I got into this business so many years ago). :)

It is wise for him to stop discussing details, but unfortunately it's a little too late. He already has opened his mouth and removed all doubt..

I think the clincher was the fact that he had also been threatening some
people in e-mail as well - indeed, he once e-mailed me and literally told me to
shut up and never to dare contradict him again, or he promised that there would
be trouble. Of course, it strenghtened my resolve to further butt heads with
him. In any case, the NZ government people agreed , after surveilling his
activities for a week after I tipped them off, that he was definitely in
violation of any user agreement he may have had with them.

actually I was referring to TiFKAS' puny attempts to try to preach to the
converted in this forum - and his puny laughable attempts to impress us with his
alleged "Apple Power Rep" job, his alleged bimbos, his alleged nice car, his
alleged laptop. Really if he had ANY AMBITION, he should be posting his drivel
to the PC forums, as those are the ones he should be trying to derive market
share from. Alas, he's as inept with them as he is with us - I saw him trying to
debate PC users with his usual tactics and drivel on a pro PC/anti-Mac web site
and well, it was like watching raw meat being thrown to starving lions :)

unfortunately, when a REAL debate comes up, Mr. Ventura acts like a big
baby or runs away. He's STILL too yellow to come to Ontario and debate with our
fisheries minister over why Minnesotans have to follow the same rules like
anyone else when they come to Ontario and have a catch limit...

TiFKAS = The iDiot Forever Known As Sinclap , called that because:

a) he's an idiot, and

b) he'll always be known as Sinclap.

And as usual, his imaginary friend "Chunks" has not now or ever existed..

Be more specific if you can. I suspect you cannot. The above statement is so general and silly as to make further discussion pointless.

You obviously know nothing about the video market, apple-cheerleader MacParroting notwithstanding..

> become an over night expert?

AVID didn't become the editiors of choice of major film studios by being buggy.. movie studios can afford to buy ANYTHING, and they buy AVID. No they aren't perfect, but over the years they are QUITE good. I can honestly say I've NEVER had a crash that caused loss of data with my AVID.

AVID is several generations old.. they have learned from their mistakes, and have created an excellent product.

Did you read the recent Macworld review of FCP? In case you missed it, they didn't think it was worth buying if you were a current Premiere/After Effects user.. and forget about AVID. They obviously had a reviewer who knew better then to compare it with an AVID.

Moron, I'm not afraid of any format, because I use anything that works.. including FCP, when it works better then what I have.

I wish that too - because, like Milken, you would have wound up with your
ass in jail... :)

BTW, just so TiFKAS knows, Nick Leeson is the guy who lost £1 Billion in
the Bank Of England in a stock-market swindle - and also wound up with his tush
incarcerated...

Glad to see that TiFKAS has the desire to go to jail - maybe hard time
might give him a strong dose of reality.... :)

I reckon it looks like one of those cute little hand-soap
dispensers you find in posh toilets in hotels. Those have
been around for years so maybe there is some copyright for
Macintoss to explain there?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

3903. Rebuilding an Atari TT .. I need your help!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-07-07 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3783A08B.4A8E@geocities.com>
Source record: 3166
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.atari.programmer,stgt.atari

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be challenging.
and a few other chips/components - again, possible problem, since more than likely these chips taken
were probably rare. Anyone deal
in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

Company Press Release

SOURCE: BancBoston Robertson Stephens

BancBoston Robertson Stephens Upgrades AAPL to a Buy Rating

SAN FRANCISCO, July 8 /PRNewswire/ -- The following is being issued by
BancBoston Robertson Stephens, a member of the National Association of
Securities Dealers, CRD number 41271:

BancBoston Robertson Stephens computer systems analyst Alex X. Mou today
upgraded Apple Computer (Nasdaq: AAPL - news) to a Buy rating from a
Long-Term Attractive. Apple Computer is a leading PC vendor and one of
the most recognized franchise brand names in consumer-computer market.

``We are upgrading Apple to a Buy rating from a Long-Term Attractive,''
said Mou. ``We believe Apple is well positioned for the September
quarter, with a
strong-product lineup following a solid June quarter. We expect that the
software portfolio will provide upside to earnings and margins with the
release of
Sonata in the fall and Mac OS X early next year.

``We are raising our estimates from $2.75 to $2.80 and from $2.86 to
$3.00 for fiscal 1999 and fiscal 2000, respectively,'' said Mou. ``In
addition, we have
established a 12-month price target of $75.''

Clients interested in receiving more information should contact their
salesperson at 415-781-9700.

BancBoston Robertson Stephens is a leading international investment
banking firm focused on growth companies. The firm's 55 equity and high
yield research
analysts cover more than 600 companies. Additional information is

Teaching CompUSA sales staff about Apple and the Mac
6/30 - Rodney O. Lain

If you agree with everything that I say, then you're not
thinking.

--I once heard someone say this

A few weeks ago, I reported CompUSA's new initiative to educate its sales staff on things Macintosh. Last week, I mentioned that my boss at CompUSA asked me to help lead the Mac classes. Well, this week we completed that training, and I must say that I am actually becoming more optimistic about CompUSA as a national Apple Macintosh presence.

Here's the gist of what happened:

We had two classes -- the Tuesday night session for half of the sales staff and Thursday night for the second half of sales guys. The first night was more of a lecture and a hands-on with the store's demo Macs.

Tuesday night

The Apple rep conducted the first half of the meeting. He outlined the Mac market in the Twin Cities; I was pleasantly surprised to find out that the Twin Cities is the fourth-largest market for Macintosh sales, given the heavy concentration of publishing houses and creative-content professionals. He also gave a breakdown of the Minnesota demographics; i.e., he described the typical Mac user.

Then it was my turn.

Maybe I'm becoming a more mature Mac bigot, but I had no urge to describe the Mac as the world's greatest computer (even though it is). My approach was more of an appeal to their logic. I explained the statistics supporting the fact that the iMac is the best-selling computer since its introduction. I gave the anecdotal example of a customer whom I had met. She said that she'd been in the store earlier that week and a sales person talked her out of buying a Mac. I told the group that that woman had bought no computer, when in fact, she had come there specifically to buy a Mac. The store lost money due to some idiot sales person's dislike of the Mac.

"Hey, I sell Packard Bells, if that is what the customer wants," I told them, "even though I hate Packard Bell computers. You should have the same approach towards the Mac. The sales person's computer preference should have no bearing on the customers needs and wants."

I stressed the fact that the Mac is no different than any other computer, in terms of sales: it has peripherals; it has software. I explained that Mac users buy a disproportionate percentage of software, peripherals, etc., considering the Mac's small market share.

I explained that the Mac OS is the #2 consumer OS in the world, a fact that people consistently overlook. I explained that the iMac single-handedly made USB an (emerging) standard.

After my presentation, the staff was shown a video on the Mac OS. After that, the Apple Rep and I led a tour of the Apple section and demonstrated the features of the iMac.

As the Apple Rep talked, I pulled aside one of the sales people and asked, "how long does it take to network two PCs?" Then I asked that he time me as I network the display iMac and my PowerBook G3. I clocked out at 2 minutes, 47 seconds. When there was a lull in conversation, I told the group what I'd just done.

"He actually did it in just 2 minutes," my "timer" noted, "it took him 47 seconds to remember his password."

Several of the sales guys asked questions afterwards and expressed more than just a passing interest in the Mac. There was actual interest.

Thursday night

On Wednesday night, I caught a brainstorm. I was playing around with my PowerBook and noticed that I had Microsoft PowerPoint (which I'd been meaning to learn). I thought it would be a great idea to put together a slideshow presentation. So, one hour later, I'd put together something to present Thursday night. Did I mention that I'd never created a PowerPoint presentation before?

Anyway, the next night, I got to the store and set up the projector to run off my laptop. I also made sure that when the staff made in, they'd see the OpenGL screen saver that I have recently installed. That gave me a chance to make a nice segue into the fact that SGI's OpenGL API's are the standard for game development, and that it is now a part of OS 8.7 and beyond.

Thursday night's training went well, also.

The aftermath

The results of the training are pretty evident. The sales people spend more time in the Mac section nowadays. They spend time keeping the shelves stocked; there are more people involved in the Mac sales (if we could have more to sell, it would be nice, though).

I also took advantage of the situation.

One of the sales staff mentioned that it's hard to sell Macs, because many of the peripherals, software, and hardware are not in stock, even though we know they all exist. I asked

our manager why CompUSA doesn't stock
the peripherals that are being sold for the iMac (USB adapters,
SuperDisk drives, etc.). I did that for two reasons:

1.I really wanted to know, and
2.that shows the sales staff that it isn't Apple's fault for not
having inventory in stock.

A few hundred more complaints/suggestions of this sort, and we'll have
Mac peripherals in the store for a change.

A side-point to all of this: on Sunday, two customers came in who
turned out to be CompUSA employees. Professing
to be big-time Mac users, I asked them if they have any "pull" with Jim
Halpin (CompUSA's CEO), for I wanted them to
pass on some complaints of mine. It turned out that they are national
trainers for CompUSA' larger corporate
accounts. We talked for a long time, and I noted that if CompUSA
doesn't shape up that iMac sales may go to places
like Sears.

Another interesting side-point to all of this is now that I know
PowerPoint, I spent the weekend putting on
PowerPoint presentations (when sales were slow) -- something I plan to
do on a regular basis now. You see, I
obtain regular copies of the Apple Sales and Marketing Resource
Library. This is a set of three or four CDs chock full
of the latest info on Apple products (congratulations to Apple's
marketing group. Suggestion: could you make the disc
a hybrid CD? You know, for Windows and for Mac? Not all sales have
Macs&#65533;). For example, this month's CDs consist
of complete PowerPoint presentations on the PowerBook G3 Series, Final
Cut Pro, QuickTime 4.0, WebObjects
"Success Stories"; also included are QuickTime movies of Worldwide
Developer's Conference speeches/sessions (the
Mac OS 8/8.7 Overview, OS X Overview, for example),

The PowerPoint files are a great help. I set them to run &#65533; la a store
kiosk. I set them to loop continuously and
swapped them out regularly throughout the day. Customers were treated
to presentations on Apple products, as
well as DVD movies ("Austin Powers" and "A Bug's Life").

All in all, I think that things in our part of the world are doing
nicely. If the management in other stores put forth the
effort that we did, then the implementation of Mac training at CompUSA
will be a smashing success.

>Mujahideen...

ah, but I (not your imaginary friend "Chunks") do have some legacy in the Atari world. I'm on at least two of the available Atari CD-ROMs, and a number of my articles for Atari Computing are on the new Renegade Evolution #1 CD-ROM. So I'm taken seriously by my peers, unlike you, Internet "Kook" of the Month.

and again - there are no "Atari Jihads" who are "out to get you". Maybe it's time to increase the your Prozac dosage?

>
>> Glad to see that TiFKAS has the desire to go to jail - maybe hard time
>> might give him a strong dose of reality.... :)
>

>

<snip>

sorry, TiFKAS, but that's inadmissable evidence. For the very reason that Particle Salad mentioned when he read it through the first time - THERE IS NO EVIDENCE THAT IT IS YOU THAT IS BEING TALKED ABOUT IN THE ARTICLE. Unless you are either Rodney Lane (the author of the piece), or in a desperate measure are attempting a la Single White Female to take on someone else's personna.

Note, too, that the posting that you have made I cannot call up under either NEWsie or CAB 2.7 - not because my Internet clients or ISP are "inferior" as you claim (Internet Direct, my ISP, is one of the biggest and most well-respected ISPs in Canada), but for the simple fact that the document IS NOWHERE ON THE SERVER YOU CLAIM IT IS. But then, this is the same amount of kack we expect from someone who claims one needs a new web browser when they get a 404 message from another ISP...

It is obvious that you are clutching at straws. It is my belief that you are obviously not employed by any facet of the Apple organization, due not only to your woefully bad spelling as much as the many gaffes you have made regarding even the basic workings of the Macintosh (like claiming that the Mac OS is pre-emptive multitasking when even long-time Mac users admit that it is co-operative, which is a BIG difference), as well as making large uninformed claims like "Microsoft is not afraid of Linux" (which they ARE, ever read the Halloween Documents, chucklehead?)

As critical as I am regarding Apple and their management and policies, they are still a professional organization that require the utmost of courtesy, intelligence and knowledge of anyone employed by them - they are simply not the type of organization that hands out jobs to the first chump that walks in the door. And especially not to noxious little twerps like TiFKAS.

The fact that you are afraid to hang out in comp.sys.mac.advocacy to help defend your fellow Mac users, but instead choose to post your half-baked, steaming piles of drivel and parrot-sheep press-release postings to this forum that have been thoroughly refuted by professional Mac users like Particle Salad, who you have dealt with by trying to smear his professional reputation (and failed) makes me wonder what your pathology is - and whether you need professional psychiatric help to overcome your obvious inferiority complex.

As I said before - unless you are willing to reveal who is employing you, complete with company name and address, telephone number and name of supervisor to confirm, your claims of being an "Apple Power Rep" will continue to be considered to be just another part of your multi-faceted "kook" personna - as in TOTALLY UNBELIEVABLE. For once, COWARD, try to show some IRREFUTABLE EVIDENCE that you are who you claim. Or are you trying to be the next Earl Curley?

>"Whats on your PowerBook?"
> -Sinclap to Susan A.(Fellow colleague)

again, no evidence that he has a fellow colleague - or, for that matter, that any woman would allow him anywhere near 500 feet away from her...

He'd better take something with somewhat more 'mule' than Prozac!! Delusions as strong as he experiences tend to come from mind-altering substances that are normally sold on the street!! I'd recommend strychnine, or failing that a really good onion bhajee with extra curry and chili...

The Jihads may not be real but we're out there in other ways!...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Think Again...Avid just dropped prices again by upto half again...Gee I
wonder why?

An Open Letter to Avid's Macintosh Customers

We know your business is somewhat dependent on understanding
Avid?s future product directions and we have been remiss in
communicating our plans that will allow you to better manage your
business. During the past few months, it seems that we have succeeded in
confusing many of our users about the future of the Avid Media
Composer® on the Macintosh. Judging by the emails we have received and
commentaries we have seen on various forums, we have also
prevailed in making many of you angry in the process. We would like to
apologize for that, and once and for all, set the record
straight.

I realize that the wealth of NT announcements we made at NAB may
have given the impression that our focus was being drawn away from the
Macintosh platform. Let me reassure you that this is not the
case. We never had any intention of abandoning our Macintosh users --
after all,
let us not forget that we built our business on the Macintosh--
but following the blizzard of publicity on our new NT releases, we now
understand that is exactly the impression that we managed to
create.

Many of our customers are demanding solutions on both Macintosh
and Windows NT platforms. To meet that customer demand, we
absolutely needed to develop NT based solutions. But at the same
time, we also worked hard to make these solutions compatible with our
Macintosh-based products so that no one would feel that they were
being forced in one direction or another. During this time we have never
ceased to develop on the Macintosh.

At NAB this year, we introduced uncompressed video and a host of
editing improvements to the platforms. As a matter of fact, I think it

would
be fair to say that it was one of the most significant product
announcements in our history. Today we have one of the most
comprehensive
Macintosh offering of media products in the industry (which
includes Avid Film Composer®, Avid Media Composer®, Avid Xpress(tm),
Avid storage, Avid Unity MediaNet(tm)a, Avid MediaShare(tm) Fibre
Channel, Avid Cinema®, Digidesign ProTools®, Softimage|Elastic
Reality® and Digidesign Audio Vision®.)

So where are we going with our Macintosh-based solution? The best
place to begin is with a clear description of what we are and are not
doing
on the Macintosh.

Here's what you can expect on the Macintosh:

Promotional price reductions: We have heard from many of you that
the price we established was simply too high for many to afford and we
are responding to it. First, we are reducing prices of new system
purchases by as much as 50 percent for customers who wish to remain on
the
ABVB platform. Secondly, we are reducing the price of upgrades
with the introduction of a discount of up to 28 percent. This means that
any
customer owning a PCI-based Media Composer ABVB system can
upgrade to Media Composer XL Version 8.0 for Macintosh with a
Meridien board for just $17,995 [USMSRP]. Prices are for boards,
kit and software only and this special promotion runs from July 21 -
September 15, 1999.

New "Millennium Edition" Release for Avid Media Composer®: We are
now working on the next release of Avid Media Composer for the
Macintosh. Called the Millennium Edition, this upcoming release
is planned for mid-2000 and will include the following enhancements:
support for the upcoming G4 platform, additional AVX plug-ins,
and Pan & Scan for video images.

New model of Avid Xpress: We are also bringing our Meridien(tm)
video subsystem to Avid Xpress for Macintosh, providing the next
generation of video quality, uncompressed images and media
compatibility with Avid's Meridien-based products on Windows NT. This
will
be made available as an upgrade in September 1999.

Customer Choice Program: For those who remain uncertain about
whether they can safely invest in additional Macintosh systems, we are
offering a new program designed to take any perceived risk out of
the choice. Any owner of a Macintosh-based Media Composer XL system
will be given the option to convert to the equivalent NT-based
Media Composer XL system for only $12,000 [USMSRP] within twelve
months of purchase.

New Avid Macintosh Development Group: We have created a dedicated group within Avid to develop additional features for the Macintosh-based applications. We will work with Apple to optimize the capabilities of the platform and maintain a close dialog with our Macintosh user base to be sure that we are supporting your needs. Although much of the work done at Avid applies to all of the platforms that
we operate on, we believe that, at this juncture in our history, it will be helpful to have a group of people whose sole mission is to respond to
the needs of Macintosh customers.

But now allow me to be equally clear about what we are not intending to do.

We have no intention of bringing our high-end finishing solutions to the Macintosh. Features like multistream uncompressed video, 24 fps feature film editing, universal offline capabilities, advanced color correction, and the graphics capabilities that characterize our Symphony and
DS product lines are not currently in our plans for the Macintosh. Our intention is to focus our Macintosh effort on editing capabilities and
the features that are most important to the editing task.

We hope you will agree that these steps are responsive to concerns that you and your fellow editors have raised. Our goal will be to provide
the best editing system available on the Macintosh for as long as you, our customers, continue to support the product. We will make sure that
you can continue to invest in the platform and realize the value that you are seeking from an Avid solution.

Most importantly, we will always try to be candid with you about what we are and are not intending to do on the platform so that you can make
decisions that are appropriate to your business. As a first step to openness, we are setting up new email box mac_business@avid.com to allow
you to ask questions and express your views.

Finally, let me just say once again that you have our sincere apologies for the confusion and uncertainty we caused on this issue, and our
complete commitment to do better in the future.

Sincerely,

Bill Miller
Chairman and CEO
Avid Technology, Inc.

I am not in CA...FYI: Ontario truck drivers need to learn to drive in
the Twin Cities. Have seen lots of Minetoba(sp?) drivers that serious
need a driving lesson here...One did an illegal u-turn next to the local
Starbucks...Whats with the migration down here? The economy nosedived
in the state?

At least something is going right up north. I bought 100 shares of
Corel Corp last month for under $4 a share. Less than a month later
closed at $5.50 today..A nice return thus far..

I expect my Apple shares to go bonkers today due to the strong
earnings...$200 + million with a expected $500 million buy back of
shares from the $3.1 billion cash hoard on hand with only $300 million
in long term debt...Can't argue with the balance sheet.

Also 487,000 iMacs shipped in the quarter...So much for the Mujahideen
Chunks iMac doom and gloom...

>

Sorry, I'm refering to iMacs of course!!

Some hotel latrines I have seen have these plastic hand-soap
dispensers stuck on the wall. They have a translucent lid on
top that lets you see how much soap is left. It had occurred
to me that they look remarkably like iMacs!! (or vice-versa)

Thats why I wonder if Apple have breached a patent on a soap
dispenser design!!

;^)

Fellow sportsfans....

Looks like the Amiga will rise from the dead with new hardware and OS
software based upon new technology...Read all about it from

http://www.cucug.org/aminew.html

You see, the new Amiga has a chance since GateWay is behind it unlike a
little known company that is repackaging old 68K TOS technology with a
high price. The Amiga hardware will be new and cutting edge and backed
by a real company.

But the typical Atari Mujahideen response will be as usual and in
denial..

>high price.

As usual, TiFKAS is trotting out the same tired old arguments which only prove he doesn't know what the hell he's talking about.

The new Milan (which will hopefully be Atari-badged) features an updated TOS produced by Milan GmBH themselves; indeed, new Milans also feature the latest version of MagiC, 6.1, as its recommended operating system - a true pre-emptive operating system, unlike the co-operative model in the overpriced, overhyped, underpowered iMac (read FLAWED). As for price, it is more competitively priced, which has led to its great success in Europe averaging 50 units per month (the best showing for a TOS clone so far). How many Gateway-produced Amiga clones have been sold in the past year? Zip.

The Amiga hardware will be new and cutting edge and backed
>by a real company.

the notable thing about the press release about the new Amiga is that they are still not revealing what processing chip they are using in it! As well, they have raised the ire of many users and developers by dropping the current operating system in favour of a Linux-based system.

Gateway has had the rights to Amiga technology and the name for three years, and yet the only thing they've produced in those three years is excuses. In that same time, we've seen several Atari clones come out from Milan and Hades.

Please note that the both the Hades and Milans have added to the rock-solid foundation of TOS such things as PCI card slots, IDE drive support, faster processors. Also, the newest Milan will feature USB.

Milan GmBH is a a real company based in Germany- and a company that, if they saw the type of FUD that TiFKAS, a known non-expert and clueless troll with no

life, was spreading about them, would gladly respond to him with a major lawsuit.

>But the typical Atari Mujahideen response will be as usual and in
>denial..

grammatical syntax is wrong there.

And as usual, TiFKAS is hallucinating about imaginary "Atari Jihads" who are "out to get him" and the Macintosh. Time for his next trip to Bellevue..

("Don't worry, Mr. Sinclair, after thsi next series of treatments we're sure that you'll never see another one of your imaginary Jihads or your equally imaginary friend Chunks - just let us apply these electrodes to your head, lie back and relax. Ready to start the treatment - CLEAR!")

PS to Amiga users - please feel free to respond to both me and this moron on this question, as I think it would make for a lively debate...

according to an executive at Milan GmBH, the timetable is to release the
new Milan in Europe first on January 2000, with a projected North American
launch in April 2000.

You'll find the news at http://bengy.atari.org/ali.htm .

Upset at discovering that, in the grand scheme of things, he was nothing
but a zit on the buttocks of progress and he was about to be squeezed, The
iDiot Forever Known As Sinclap portrayed his vast ignorance when he wrote:

>This newgroup has died during my absence due to busy work and pleasure
>schedule.

more likely your absence was due to the fact you had your chin caught on
your sphincter again.... or you were too busy playing with your sock puppets
(especially the one with Pamela Lee's face stapled to it that smells a little
funny - better not let Mummy catch you playing with her again...)

>Remember...it's only a computer, a tool...not a religious
>crusade or awakening..

we can agree that TiFKAS himself is a tool...

and as for his self-righteous declarations, it seems rather hypocritical
seeing that he continously blindly obeys Steve "the Ayatollah" Jobs no matter
how ridiculous his pronouncements from the Reality-Distortion Field. One can
well imagine TiFKAS gladly doling out the Kool-Aid to other drooling Mac
fanboys...

> On 9 Jul 1999 04:33:24 G, having been told by the angry husband that was a gun
> in his pocket and he wasn't glad to see him, The iDiot Forever Known As Sinclap

so, he's admitting he's a mutant - comes from years of Sinclair inbreeding..

> ah, but I (not your imaginary friend "Chunks") do have some legacy in the
> Atari world. I'm on at least two of the available Atari CD-ROMs, and a number of
> my articles for Atari Computing are on the new Renegade Evolution #1 CD-ROM. So
> I'm taken seriously by my peers, unlike you, Internet "Kook" of the Month.

>Wow...I did not know that Atari offered cd devices....

funny, since I told you about CD-ROM support for Atari devices over three
years ago. Proof that TiFKAS either is too dense to read everything, or is
deliberately ignoring the facts about Ataris in his one-man disinformation
crusade against anything with a Fuji on it (and is dismally failing)...

Since then, a number of technical breakthroughs from dedicated Atari
programmers have expanded the capabilities of CD-ROM, including adapting IDE
CD-ROMs to older STs to burning your own CDs and doing backups to writable
CD-ROMs. Indeed, it must be sticking in TiFKAS' craw that an "obsolete" Atari ST

can produce CDs, let's see him try that with a Mac Plus...

BTW, I'm currently enjoying the benefits of a brand-new Toshiba 40x SCSI drive on my system - part of my improved financial situation.

>Anything lately? How about the Be platform?

seeing as Be isn't producing an updated OS to take advantage of the new G3s (due to Jobs' fear of a superior OS showing up the bloated Mac OS), I can't see what TiFKAS is crowing about.

Oh, yes, we've had Linux for a few years now...

>
> in Canada you would be serving hard time for those crimes. Millhaven or the
> Don Jail would be the perfect places for you to start contemplating reality.

>I am not in CA..

but if you were, you would be serving hard time. And, FYI, if you pulled a similar stunt in the country where Nick Leeson committed his fraud (Singapore), you wouldn't be living in a country club enviroment, indeed, you'd probably start your sentence by being caned....

>Whats with the migration down here? The economy nosedived
>in the state?

obviously you flunked political science if you don't know that we have provinces in Canada, not states. And the Ontario economy is doing finely, thank you - we're the leading province in new job creation.

>At least something is going right up north. I bought 100 shares of
>Corel Corp last month for under $4 a share. Less than a month later
>closed at $5.50 today..A nice return thus far..

yup, Corel has been doing well, due to their master-stroke of embracing the growing Linux community and providing some superior applications for them, like WordPerfect 8 - over 1 million downloads from ther web site - and their announcement of offering a consumer-friendly Linux installment for home-desktop use for this fall. Interestingly, seeing as all Apple development has been placed on the back burner...

BTW, those nice people at Caldera gave me a free copy of their OpenLinux 2.2 CD during my visit to Comdex, so it looks like I might find a cheap PC to try it out to fool around with. The Linux area of Comdex has expanded greatly - ten times the size of their area last year. Interestingly, Apple themselves were nowhere to be seen - perhaps they're scared?

>Also 487,000 iMacs shipped in the quarter...So much for the Mujahideen
>Chunks iMac doom and gloom...

still living under the delusion that your imaginary "Atari Jihads" and your equally imaginary friend "Chunks" exist? Perhaps another trip to Bellevue, and stronger voltage, should cure you your malady..

Yup, 487,000 iMacs shipped, but notice that it doesn't mean that they've found consumer homes, just that Apple is using CompUSA and Sears as auxillary warehousing - one of the reasons why Best Buy pulled the plug. As TiFKAS should have learned from his stupid mistake regarding trusting news stories from the Daily Tubby, empty Apple warehouses do not equate to consumer sales - and why I was easily able to find the "Unattainable" YUCKs as well as numerous Rev. Bs at a number of shops across Toronto throughout the entire month of April...

And if you're going to post stuff from the Apple quarterly, TiFKAS, you should also mention that the report also notes that B&W and PowerBook sales are significantly tanking compared to the previous quarter. Expect Jobs to announce a further fire-sale reduction of B&Ws at MacWorld this week...

>

>Your ISP is serious _ucked if you can't get on theimac.com/

"PETER! DID YOU SAY THE "_" WORD!? MUMMY WILL HAVE TO CLEAN THOSE FILTHY WORDS OUT OF YOUR MOUTH!"

(picture TiFKAS' mummy in the bathroom with TiFKAS in a headlock, washing out his mouth with carbolic soap).

BTW, TiFKAS - Internet Direct is the host ISP to TUCOWS, a site which requires a lot of room and power. Care to remove your foot from your mouth?

>I can log on all the time using NS and IE.

funny, I can also log onto theimac.com utilizing CAB 2.7 - but nowhere can I find your alleged article (which is moot anyway, seeing as it's Inadmissable Evidence).

> Looks like a you know what issue?

looks like we can add "how ISPs work" to "things TiFKAS doesn't know what the hell he's talking about" (soon to be an exciting new category on Jeopardy!)

>You can email a request to Rodney O' to send a copy...

but that'd be a waste of time, seeing as there is NO PROOF that you are the alleged "Apple Power Rep" he was talking about (if the article even exists)

I'd rather get the proof of your employment from the horse's mouth - i.e., your supervisor at your work. Please post company name, address, supervisor's name and phone number where he can be contacted at work. Failure to do so will only prove what we've all suspected - you're a coward, and a proven Internet "kook" who can dish it out but can't take it...

> It is obvious that you are clutching at straws. It is my belief that you are

>Guess Again...

I'm not guessing, Chucklehead - I KNOW.

>Did you know that many politicians and busines folks are 'lozy
>spilliers'? and quite possibly kan't wreid....?

but that is no excuse for an "Apple Power Rep" - once again, they have standards which they require all their employees - which you would easily fail...

> As critical as I am regarding Apple and their management and policies, they
> are still a professional organization that require the utmost of courtesy,
> intelligence and knowledge of anyone employed by them - they are simply not the
> type of organization that hands out jobs to the first chump that walks in the
> door. And especially not to noxious little twerps like TiFKAS.

>You will never know...

oh no?

I'd suggest you check out http://www.apple.com - they have a listing of what they expect of their potential employees, as well as a detailed description of how their interview and selection process works. It's very well designed, and there's enough checks and balances there to prevent morons like you from gaining employment to a professional company...

> The fact that you are afraid to hang out in comp.sys.mac.advocacy to help

well, look at it this way - the Tramiels are IN NO WAY involved with the development, manufacture or distribution of the Milan. So it's already got a number of advantages already :)

BTW, how's the weather holding up in Alberta? Or should we wait a few minutes :)

Especially since this has been public knowledge for a long time, and
Amiga would look foolish should it try to ignore these problems.

Key partnerships, yet they only name ONE company with which they're
working?

And they're looking at locking themselves into a proprietary built-in
solution (making them dependent on ATI) when everyone else is using
AGPs? Foolish.

In other words, a relatively modern computer box, much like current G3 boxes -- with the exception that we STILL don't know what chip they're using.

Wow, a primer on USB. This certainly isn't a tech brief; anyone who knows anything about PCs or Macs built in the last year knows that this technology has already been implemented.

This is just Amiga playing catch-up and teaching ignorant Amiga users
about technology they may never have encountered before.

> We have selected a very exciting CPU for the MCC,
> which is at the heart of a next-generation
> processing subsystem.

"But we're not going to tell you what it is."

> Audio / Video: * DVD drive standard (DVD-RAM when available)

It's already available, dumbass. It's just that you don't want to spend
$500 for OEM DVD-RAM drives because there are so many cheap Amiga users,
they'd choke on their McDLTs if they were asked to pay for a modern
system with choice HW like DVD-RAM.

I too have been _waiting_ for the Milan, but since reading that thay
have been selling 50/month in Europe/Germany and knowing that GmBh
Milan is NOT a large company with deep pockets, I can understand that
they have not had the time or _machines_ to sell to NA. Thay have had
their hands full just keeping up to the European market!!
but with Motorola in the picture, perhaps we can expect something in
2000, as Bengys interview with Milan attests (btw, get to Lethbridge
much, have you met Bengy? it's a nice drive, I know I did it often
enough, don't miss the coolies or OldMan river!)
Regarding the NA market though, CENTEK has a dealer in Canada, and he
is selling CENTEKs CT2 board, and hopefully the Phenix when it comes
out, and that is Homa Systems (Nima Montaser). So even if the Milan
does NOT make it to NA, if you've got the itch for a new high powered
Atari, Homa Systems can help! :-)

Looks good for Amiga fans! The new Amigas should be good for desktop video...which in turn may not be such good news for Mac users! Milan is an upgrade path for Atari users, NOT Amiga or anyone else. TiFKAS has again failed to give us the full picture on the Milan deal!! But then again who are Motorola, the guys supporting Milan?!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The entry level new Amiga model will be priced in the same ballpark as
the new Milan which is using outdated technology. These new Amigas will
be new period...What do you not understand?

Why would a person with a half a brain would opt for a TOS bucket when
there is new exciting competeting line comming out?

Also, there is not enough TOS Jihads out there to adequately support the
Milan...

So it's not out yet here in NA yet. Isn't this like calling GateWay's
Pot Kettle Black?

GateWay is bringing out cutting edge stuff not repackaged 68k technology
that no computer firms are using more. I suppose the TOS Jihads like
sticking to the past and afraid of new that may bite them..

The current Amiga's are availble....

So have you bought a MILAN yet or is it still to high tech for you?

Are you deaf, Sinclair? Blind? I wonder. We've offered proof
positive, time and time again, about all the advances that
TOS OS's and hardware have made in the last few years and
still you act like we are all using TOS v1.0 (from disk)
on .5 meg memory 520ST's built in 1985. Get over it son,
we have moved on, why can't you?

BTW, I see you gave you usual (inappropriate) response to
a user with a legitimate request for Mac-related help. Is
this how you deal with you customers as well, being the
Mac "power rep" that you are? ;-))))

"Bengy" ????? Not only have I never met this person, I haven't been to Lethbridge for about 20 years - drove past it once going to Montana when the Dollarette was at par - but that's about it !

Homa Systems is in Ontario - is it not - I try to deal only with local dealers - had too much bad luck with 'aliens' like Toad over the years.

True, m'dear Dan - but - I'll still not hold my breath. After my recent 'Apple experience' (which ended with Apple Canada replacing the machine) I'd love a stable TOS platform - but ????????

> BTW, how's the weather holding up in Alberta? Or should we wait
> a few minutes :)

Coldest, wettest July on record ever - at the moment sunny and 18C (going to 25 - ????) - but yes - wait a minute, it'll likely change.

The Canadian Curmudgeon (in changeable Calgary)

You are a silly, childish moron.. are you SO lacking in a life that you choose to engage in debate over platforms you have no interest in or knowledge of?

Sinclap.. don't you have something positive to contribute to the world? Is all the time you spend doing this really making up for your lack of self-confidence? Does it really help you feel better?

Only a child would build up his self-confidence by denigrating the choices of others.

> Think Again...Avid just dropped prices again by upto half again...Gee I
> wonder why?

Think again? Well, that would be one more 'think' then you're evidently capable of.

Exactly WHAT above displays ANY of your knowledge of the video market? Are you REALLY stupid enough to believe that FCP has direct impact on AVID pricing? Do you know there are at LEAST 4 manufacturers who have sold more video eding software then Apple? AT LEAST.. yet you still think AVID sees FCP as a threat to their business.

Now, you might argue that there is a potential LONG TERM threat to AVID's business.. but there is no direct threat. By repeating the same thing over and over you prove your lack of understanding of the video business.

Give it up.. remember, it's better to be though of as a fool then to open your mouth and remove all doubt. Talk about what you KNOW.

I have absolutely no real knowlege of the Avid market other than some of their customers are quite dissapointed to have to leave the mac...

That said Final Cut Pro is drop dead wonderful software. It is probably the strongst version 1.0 product I have ever seen. Though Apple says it compliments Premiere and After Effects I relly have to say I feel it makes Primere out gunned and out classed by miles. Afer Effects?? well FCP can do all of Primere's time line editing and do it twice as well, but after effects it can only do half of... FCP has some really nice Compiositing features and can do blue screening as well as running AE filters and plug in's. I think that by version 2.0 of FCP Adobe's Video product line could

really be introuble on the mac side.

Anyway the only real weakness with final cut pro are the messages apple sends out about support. It runs on a much wider variety of Hardware than apple lets on and should be certified with many diffrent capture cards. It is actually killer software. And if it could be intigrated with more broadcast systems than just what firewire allows it would take a big chunck of the market. I can't tell you how much I like Final Cut Pro.

Let me remind Sinplop that the Atari CDAR CD-ROM drive was the FIRST EVER
commercially available CD_ROM drive!! ie...ATARI STARTED THE WHOLE THING!

It never took off under Atari but boy did the masses flock to the new
technology like wasps to the rotting carcasse...

Hi there,

sinclap wrote:
>
> The entry level new Amiga model will be priced in the same ballpark as
> the new Milan which is using outdated technology. These new Amigas will
> be new period...What do you not understand?

I understand everything. It is YOU who do not understand that WE Atari users would rather go to an 060 powered Milan than an Amiga, because we like the Atari OS's and apps more than Amiga or other platforms. It is like you consider that to be a criminal offence! Also, a 68060 at a clock rate of 80 odd MHz is comparable to about a 250MHz Pentium or say a 200MHz PPC 603e. Many people still are happy using older PowerMacs and Pentiums. Atari software, in particular, seems to make better use of the available CPU grunt than Mac/PC software. I doubt you have seen much in the way of Atari software run on Atari machines Mr Sinclair-Day, but could you imagine software that is usable on 8MHz 68000 or 16/32MHz 68030 being run on a superscalar 68060 at 80MHz? It would fly in comparison. THATS why I'd rather have a Milan060 than a new Amiga! I've never owned or used much in the way of Amiga so why should I start now?

> Why would a person with a half a brain would opt for a TOS bucket when
> there is new exciting competeting line comming out?

What is the new Amiga competing with? NOTHING!! The new Amiga is a quick new upgrade path for Amigans who until recently have only had a few add-on 060/PPC cards to give their machines that extra 'pep'...and I'm sure I have more than half a brain thanks kindly...you silly little piece of football players toe-jam you...

> Also, there is not enough TOS Jihads out there to adequately support the
> Milan...

50 a month in sales of Milan. For a small company thats pretty good! Get it right monkey boy!! That will accelerate when Milan060 is out...

I posted a while back that a NAVAIR Captain has ordered no further Apple purchases for use within the NAWCWDPS. There was of course a loop hole that allowed die hards with certain requirements to justify an Apple purchase if necessary. A justification must of been submitted before the purchase, and purchases made only after approval. I had to laugh my ass off yesterday when I found out that these responsible DOD Apple users had been abusing the order, and caused both of our U.S. Government credit card holders to have their cards yanked! I mean flat out yanked, even the ability to complete obligations already made for items other than computer purchases. This also includes any repairs that the four failed new G3's needed:). This is going to be great watching them work this out.
Talk about Jahids.

: bomb... ;-(

Indeed. It should be noted, though, that the end user agreement for the
Amiga forbids any development of nuclear bombs using Amiga technology. =)
While the Atari has already trodden the part of using a UNIX kernel
(MiNT), and MacOS is to do the same (NeXT(MacOS X), I'm not happy at all
about the change of kernel on the Amiga. The Amigas kernel (exec) is
extremely compact, written entirely in assembler and holds much of the
responsibility for the speedy multitasking of the AmigaOS. The Linux
kernel is quite the opposite, very much monolithic, written in C and using
another MT approach. I don't look forward to this at all. Mind you, I'm
not looking forward to the next gen Amiga in genmeral, either.

Don't count on it. Apple has had a steady price of $1199 for the imacs
in the last 6 months. This is true with the G3 B/W's. Apple will most
likely boost the clock speed and maintain a $1599 price.

> If March rolls around and the iBook _still_ is priced at $1,599, then

Don't bet on a price reduction. Apple keeps a hald days worth of
inventory and can put a break on manufacturing if demand slackens. Most
likely a promo instead of a price cut.

Do you really believe that?. Unlike a certain group of computer users I could mention, the general Amiga population is very knowledgeable where new products/technology is concerned.

Sounds like a case of sour grapes to me.

In any case, why would you care?. The 68k line is a dead horse that Milan and Hades are still flogging.

The new Amiga is intended to gain users whereas the Atari clones are designed to maintain users... and that is the difference.

As always... IMO :-)

Regards,

Clockmeister.

It's impossible to trust the opinion of someone who continually demonstrates a lack of understanding in where their scope of knowledge begins and ends.

You continually ramble on about things I've proven you don't understand, like desktop audio and video.

Learn two things TIFKAS:

1. Understand how important it is to be aware of what you don't know..
2. Have humility.. no matter how smart you are, there's always someone smarter. No matter how much you think you know, there's always someone who knows a LOT more.

-Mark

There's a whole lot of life beyond your little machine, "sinclap." Find it and enjoy.

Not completely true. The Phoenix will be a completely different
machine, but retain the ability execute TOS applications. If Centek
can produce this machine, it will be the choice for a superior home
work station. I surely wouldn't spend any money on HPs or SGIs from
what I have seen at work. A DEC Alpha running NT native, now that
might be tempting. The Phoenix with be the "band in a box" machine for
any computer user that has always wished his computer could do
some function that others could do, but they cannot because of some
limitation in hardware or software.
I don't know the facts of the planed Amiga O/S, but if indeed it is
Unix based, will the machines still be about to operate older versions
of Amiga O/S and remain compatible with applications such as Light
Wave 3D, Shapeshifter and hardware?

Hi Clockmeister. Hmm, I dunno - dual 68060 CPU's, while still in the
68K range, doesn't exactly sound like "maintaining" to me...nor does
a PowerPC chip running at 266mhz with 256 megs of Ram!

BTW, I hear that Amiga users are not exactly happy with Gateways
decision to ditch the Amiga kernel in favor of a Linux based one.

Whats your humble opinion? <grin>

See ya later...

That's cool. I hope it is successfull, if and when it becomes available.

> I don't know the facts of the planed Amiga O/S, but if indeed it is

Amiga have suggested that there will be some form of backwards
compatibility of OS3.x, but as always that remains to be seen. Amiga change
plans as often as they change their underwear it seems.
No doubt the UAE will be ported, and the availability of a hardware
solution for disk operation compatability (for those that need it) is in
the works.

Not holding my breath, but at the same time slamming a platform before it
is released is a little unfair, hence my original reply.

Power PC is old hat as far as classic Amiga users are concerned, and
certainly hasn't increased the user base by much (if at all).
How many non-Atarians will buy the new clones based on the specs?.

>
> BTW, I hear that Amiga users are not exactly happy with Gateways

>
> Whats your humble opinion? <grin>

I am humbled...

The Amiga kernel was dumped some time ago because the work involved in
bringing it inline with Amigas vision of what the new platform should be
was too great.
QNX was the choice, but that too was dumped despite QNX having nearly
finished the OS. QNX are releasing the OS for the NG AND classic regardless
so competition is already there for when the new Amiga arrives.
Initially, that was what pissed Amigans off so much, having been promised
QNX and then Amiga changing tact again.
The Linux decision is not all bad though, as most Amigans have since
realised.
The growing number of apps, developers and users is a good thing to tap
into. If the AmigaOS (which is supposedly to be released as multiplatform)
provides a decent GUI for Linux users (sadly lacking so far IMO), coupled
with a processor base optimised for Linux, the new machine is likely to be
quite successfull.

AmigaOS for Atari anyone? :-)

Is it a real Amiga I hear you ask?.

I'll reserve that judgement until I have used one.

I have FAR more knowledge about the video market then you have even dreampt of having. It's not that complex, however, and with a little humility and intelligence you could easily learn the same thing.

I have NO knowledge about "consumer retail marketing," and I don't get into arguments with those who do. That's where you and I differ greatly.. you have continually gotten yourself in debates that you couldn't handle. With me, specifically, in both audio and video.

If your attempt at speaking as an authority on "consumer retail marketing" is anything like your attempt to speak as an authority on audio and video markets, then you have no credibility. Credibility and trust is built by admitting where your knowledge begins and ends, Sinclap.. and you apparently know no bounds to your own knowledge. Shame, really..

Your baseless rants on video and audio have done both you and apple a disservice.. you were so off base on both counts that you have lost all credibility in other areas, like "consumer retail marketing" (which I suspect, is your euphemism for being a salesman, not the same thing).

> > You continually ramble on about things I've proven you don't understand, like
> > desktop audio and video.
>
> What does that have to do with the iBook?

Nothing.. it has to do with your credibility.

> You have proven nothing on video...what do you not understand?

You have stated that Avid is "shaking in their boots" about FCP.. but ask ANYONE who does video about this, and they will say this is an extremely laughable thing to say, and demonstrates a COMPLETE lack of knowledge of the entire pro video marketplace. COMPLETE. All you have to base it on is Avid's price cuts.. which,

if you did a little research, you would find are not uncommon. As a matter of fact, any "consumer marketing" expert knows that technology always comes down in price.

I haven't "proven" it because it isn't possible for me to prove to you. In order to understand, you'll actually need to do some research yourself.. of course, I'm not holding my breath... that would require humility and honesty, two things that are lacking from at least your internet presence, if not your personality.

> Whats your point? You have not convinced me with your video denial...

Of course I haven't. Do the research yourself, I'm sure that someone who is involved in "marketing" would have access to it. Or ask those in the video industry about it..

To put it clearer for you: FCP is selling mainly to people who used Premiere or some other sub $1g software front end.. it is NOT making anyone I know dump their Xpress or Media Composers.

If you do indeed work for Apple, and someone from Apple is reading this, I would hope they might find a more effective way to "market" their products then to have someone as arrogant and ill-informed as you represent them.

No, not really. I would like to see the machine expand the user base,
even if only a few thousand. It means more software for the TOS
compatible I already have and am happy with. Unlike you and your penis.

At least I am glad I
don't own one of these G3's that are delivered from the factory
non-functional.

>AmigaOS for Atari anyone? :-)

:). I just aquired an Amiga 2000. It has a video toaster, two time
base correction cards, network card, SCSI card and a CSR 040 card.
First impression was it runs about the speed of my Afterburner. Takes
forever to boot. I really don't know much at all about Amiga, but I
wouldn't trade MiNT/N-AES/Thing for what I saw any day. It does seem
to multitask smoother than my Atari setup however. It's just different
I guess, but the windowing (Workbench?) seems a nightmare (to me:).
It's going to take me a year just to figure out how to use the
Toaster:).

IMHO:)

Really?. I don't think so. There is a reason Amigas went to PPC, be it
060/PPC combinations.

Many people still are happy using older PowerMacs and

That is a good point. I wouldn't expect you to start using one now. Having
said that, if a new Atari came out and it was the hottest thing going I
would consider buying it, regardless of the brandname.

> > Why would a person with a half a brain would opt for a TOS bucket when

> What is the new Amiga competing with? NOTHING!!

Millions of other Linux users, Windows users and Mac losers. That is who.
And no, new Atari clones aren't competing with the same crowd, they are
competing (?) on the same level as Amiga classic and Acorn users are, if
competing is the word to use.

The new Amiga is a
> quick new upgrade path for Amigans who until recently have only had
> a few add-on 060/PPC cards to give their machines that extra 'pep'...

extra 'pep' ?. That is an understatement. Do you really think that an
'060/PPC upgrade isn't as good as one for an Atari clone?. What about the
G3/G4 cards?.
Maybe the fact that big box Amigas have had a CPU slot for exactly that
reason, ie CPU upgrades, somehow means that the effect on performance of
the machine isn't as great. Explain this.

and
> I'm sure I have more than half a brain thanks kindly...you silly little

There is something wrong with this analogy. Aren't PC's highly adaptable
AND successfull?.

On first impressions Linux is a nightmare OS too, but with a little
familiarity the advantages become apparant.
I suggest you give AmigaOS a chance.
Which version of the OS has your 2000 got?.

BTW there are many workbench enhancements available on Aminet, be sure to
check them out ;-)

Regards,

Clockmeister.

Funny, with the limited production the Falcon seen, there are hundreds
of Falcon specific applications available. With the introduction of
the Milan, a new customized O/S was released, with many Milan specific
applications. The way it is snowballing across Europe, it should hit
the shores here with quite an impressive package of software.

What would those advantages be over MiNT when installed on a TOS
platform?

> I suggest you give AmigaOS a chance.
> Which version of the OS has your 2000 got?.

I had the machine running for a while with my Atari/Amiga Alpha Data
Track ball, but now it won't see the the device. There is diode type
Amiga mouse that came with it. I picked up an aluminum optical pad, but
the curser only moves in one direction. Anyway, I haven't been able to
get back in to check. It goes by to fast at boot up. The copyright date

on the workbench is 92, so it is an older version. There may be a bad connection on the 9 pin din.
>
> BTW there are many workbench enhancements available on Aminet, be sure to
> check them out ;-)

It seems that the machine is missing one of its orignal harddisk and most all of the toaster stuff is gone. There is a folder of what looks to be some extensions of somesort to convert various graphic formats back and fourth, but Light Wave is not on that disk. None of the Toaster software is there either. I hope that since you have to have the hardware to use the toaster, that the software is freely available, at least the capture and editing parts. Which brings up another problem.The 880K format floppy makes it hard to transfer files that way. I don't want to take the time to set it up for internet use. I do have three EZ 135 SCSI drives. What is the best was to get compatibility with the machines format? There is an application that looks like it lets the machine read mac disk as far as I can tell. It has a shit load of disk utilites, mostly backup stuff. Anyway, it sits until I can get the mouse thing resolved.

Excuse me, but the CDAR was commercially available, and IIRC even had
a CD based game (something like Golden Island? Can't remember - can
someone help me out here?) as well as an encyclopedia. What year did
the first CD-ROMs appear on Apple/PC's?

The Transputer was awesome for its time, and is a collectors "must
have" item now...

I have to admit I'm a little confused by your designation of the
2080ST as "vapor"...or are you just showing your (Atari) ignorance?

AFAIK, 1, 2, and 4 meg Atari ST'(e)s often used the following model
numbers:

1 meg = Atari 1040ST(e)
2 meg = Atari 2080ST(e)
4 meg = Atari 4160ST(e)

Surely Sinclap - even you can see how they got these numbers?

->Began under the PC...Even the acad libraries had them earlier than
->Atari's vapor announcement..

Again, not vapor. Just for the sake of argument, when was the Academic
libraries first equipped with CD-ROMs, what type, computer, OS, and
year, please. Thanks.

Hmmm, then the CDAR I saw in Calgary about a year or so before the first PC CD Rom hit the shelves here was only a figment of my imagination. To say nowt about the 2080st in the same shop (but, I'll admit they only ever had 1 of them) !!!

Gosh, I'll have to tell my psychiatrist !!!!

The Canadian Curmudgeon (in sunny for a change, 20C, Calgary)

That is because you probably have a harddrive missing wich may be causing
problems with termination, causing the delay.

I really don't know much at all about Amiga, but I

Sorry, I was thinking of the advantages of Linux over Windows, when
installed on a x86 platform. Point is, familiarity is the important factor

where an OS is concerned. Unless you are familiar with both OS's that you
are comparing, you can't really make an accurate judgement.

> > I suggest you give AmigaOS a chance.

Does the Amiga mouse work?.

I picked up an aluminum optical pad, but

It could also be a bad microfuse on the motherboard. The microfuse is near
the port, on the motherboard, and resembles a resistor.
Also, one of the CIA's could be flakey. It is a good idea to reseat all
socketed chips on the motherboard first though. The CIA's are two 8520
chips underneath the PSU.

If you get a boot menu when you boot the machine with both mouse buttons
pressed down, you have at least Kickstart/WB 2.0.
If not, you have KS/WB 1.3 which is very outdated.

Not sure on this, but an email to Newtek should provide an answer. (or ask
in c.s.amiga.hardware)

Which brings up another problem.The
> 880K format floppy makes it hard to transfer files that way. I don't
> want to take the time to set it up for internet use. I do have three EZ
> 135 SCSI drives. What is the best was to get compatibility with the
> machines format?

c.s.a.hardware is your best option. There are many Amiga utilities which
allow file sharing between different formats and the folks in the Amiga
hierachy of newsgroups know their stuff.

I use PC2Amiga which is available on Aminet. It allows any PC drive to be used as an Amiga drive via serial or parallel linkup. (parallel is pretty fast)

There is an application that looks like it lets the
> machine read mac disk as far as I can tell.

That is likely. If you have WB2.1 or better you will have MS-DOS format support built in to the OS as well. (be it 720Kb floppy support because you only have a 880Kb Amiga floppy.

It has a shit load of disk
> utilites, mostly backup stuff. Anyway, it sits until I can get the mouse
> thing resolved.

If you have anymore questions just email me or ask in the relevant Amiga newsgroup.

Regards,

Clockmeister.

Wrong again. I argue with someone spreading MISINFORMATION, not opinion. If you said "I think FCP is going to replace AVIDs for video editing," I would probably post once that you are ill informed and that would be it.

Instead, you said "FCP has AVID running scared" and you said "FCP is the reason for AVID's recent price reductions" and "FCP accelerates the video market." This is clearly misinformation.. and could only come from someone who is FAR removed from the desktop video world, and can only come from an "Apple Evangelist" without concern for truth or accuracy. These statements of yours CLEARLY undercut any credibility you might have ever had..

Yea.. I bet it's as extensive as the research you've done on desktop
video. Final Cut Pro taking away market share from AVID, indeed..

Its only a beginning. Just look at M$ way back when...now look
at them today! Doesn't compare does it! Of course I'd seen the
early versions of Windows (v1 and v2) and I thought they were
complete crap that my Sinclair Speccy 48k BASIC left for dead!

> My penis is fine...No complaint from the penis recepient dept...-)

So you have no callous' on your hands then? ;^)

Absolutely! Sinplop is like a Sunday newspaper...full of the sort of
crap that no half-intelligent person would even want to consider as
gospel...

> The Canadian Curmudgeon (in sunny for a change, 20C, Calgary)

Sounds nice!!! Unlike here...woke to settled snow, more snow falling,
-1 DegC, and gales yesterday. The snow eventually gave way to heavy
rain as the temperature raised to the days high of somewhere around
3 or 4C. It was impressive watching a river in central town burst its
banks with the rain/snowmelt tho'!! Yuk!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

actually, TiFKAS is more like the Weekly World News, a collection of
info that have obviously been made up that usually appears weekly, and
which nobody can take seriously - and has the demeanor and lack of humour
as their most prominent columnist, Ed Anger. Hence his constantly puts his
foot in his mouth when he gets "pig-biting mad"....

BTW, TiFKAS, you still haven't provided evidence of your employment in
any way with an Apple-related business. Ante up, COWARD.....

the theoretical NEW amiga is Linux. Hardware matters, but the reason we
like our
machines whether Amigans or TOSrs is because of the operating system and
software.
Abandonning the amiga o/s, and consequently amiga software is not
gaining users
at all, it is abandonning them.
What on earth is the difference between running Linux on an Amiga, or a
Pentium? squat!
amiga is dead. long live amiga.

Cross-posted to: alt.atari.2600,alt.games.video.classic,comp.sys.atari.advocacy,rec.games.video.atari,rec.games.video.classic

I have a huge collection of Atari games. All 330 games are different labels. Many are Extremely Rare or Rare like Avalon Hill's London Blitz and Wall Ball, or a Frankenstein's Monster Demo game that has a bright red label saying "New Game: Property of Data Age, if found please return..."; I have Xonox double-enders, Xonox single-enders like Sir Lancelot, Mythicon titles, 20th Century Fox titles like Revenge of the Beefsteak Tomatoes, games like Tapper and Up-n-Down, Jedi: Death Star Battle, and many more!

I am looking for someone who wants to buy me out completely. That means all 330 games, plus perhaps another couple hundred duplicates. Serious offers only, please. If you are near Maryland, USA, you have an advantage in that you could save money by picking it up. If you are considering resale possibilities, I also have a huge collection of Intellivision games, a large amount of Colecovision games, boxed Odyssey2 systems and games, Atari 8-bit and ST items, TI99 systems and games, Atari Jaguar, Apple II, Tandy CoCo, and C64 and VIC-20 stuff. Each major collection could be negotiated separately or bundled together. If I get no serious offers for bundled systems, I will consider selling individual titles. At this time, I am not interested in trade. US Cash or Money Orders only. Please do NOT ask me how much it would cost to ship to 'so-and-so', as I do not have a scale that could weigh everything and do not plan on hauling anything to the Post Office until I get offers. Thanks.

Please email me for detailed lists of games.

Ironically, Amiga still sells more stock A1200's a year.
Last year, just one order consisted of more then 600 units.

Comparing those sort of figures against Milan sales puts things into some
perspective I think.

Regards,

Clockmeister.

Hi Clockmeister...

What perspective? Sorry-not being a smart-alec, but we all know that
the Amiga market is bigger than the TOS market. So what you just told
me was that the sky is blue... <grin>

Actually, I'm glad to see the Amiga doing well. I've always had a soft
place in my heart for it. I have to admit though, that I'm in fear,
somewhat, of where Gateway is taking the Amiga now... ;-(

It kind of makes me think of that old adage, "we have met the enemy,
and he is us" (or something like that!) Really hope that the Amiga
is still the Amiga when they are through.

The same kind of thinking has been going on in Atari camps as well,
more since so many clones are now being produced. I actually had a
user tell me that I really didn't want to get a Hades/Milan/Phenix
or whatever because it wasn't a "real" Atari computer. Well, I've
thought long and hard on this, and nothing will ever be a "real"
Atari computer again. However, if it uses TOS as a base for its OS
and keeps the Atari philosophy, as well as "feeling" like an Atari,
while bringing it inline (or more so) with current hardware/software
standards, then I'll be happy...

I'm sure you Amigans have been having the same kind of thoughts and
or debates...! <smile>

Later, O Master of Time... ;-)

The real irony is that FCP is a rather sweet piece of software, but since
it's Mac-only and you seem to get twelve free doses of RDF-syrup
injections every time you ask about it, it is unlikely to unseat the more
well-established products in this area from Avid and Adobe.

The idea that FCP has Avid "running scared" is laughable. The fact that
FCP is a very nice (especially considering it is at version 1.0) piece of
software is undeniable.

Hey, if they come up with an NT version, I'll use it in a heartbeat.

You know, I think it probably is having an impact on Premiere sales.. it definitely is targeting part of their audience (those who use Premiere for DV capture/editing). Agreed, it IS a nice piece of software, and will be even better next rev I'm sure.

Well, let's see.. did you happen to see the new issue of "Newmedia?" You know, the one with a nice review on Final Cut Pro? Yea, they DID give it a very nice review.. but read the last paragraph, Sinclap.

Oh heck, I'll type in in for you.

"Ultimately, the assertion that Final Cut will go head to head with Avid is just marketing bravado. The nonlinear industry only sells a few thousand units a year, and Apple lacks the professional dealer channel and support to link to other postproduction equipment. What Final Cut is geared toward are the several thousand serious owners of DV camcorders and the professionals working in smaller studios, who now have a compelling reason to think Macintosh for video editing. (snip)"

One more quote from an earlier section:

"Unfortunately, Final Cut is not yet capable of real-time editing, requiring rendering of all transitions, titles, and graphics, which will limit its use among professionals, where time is money."

Taken from the latest issue of Newmedia, page 45, article "Final Cut Pro," written by Jeff Sauer.

Unfortunately, you don't have enough self-worth to actually admit your mistake.. but no problem. Game over, man..

-Mark

I can live with a Linux kernel providing the AmigaOE is Workbench-ish. A
kernel is just a kernel, and there is no reason why the new Amiga OS should
look like just any other Linux distribution. (I hope ;-)

You bet. If nothing else, there has been plenty of talk with even Jim Collas himself getting in on the action in the c.s.amiga.misc newsgroup. Unusual for a president of a company to do that, I hope it's a positive sign of better things to come.

Actually mr. Sinclair,
Atari sold over 3800 CDAR504. A significant number considering the infancy of the product and the amount of software then available. (zero) I should know I received mine in 1988. The serial number is E1921000074. The vast majority were sold in the netherlands and Germany. Less than 300 were sold here in the states. Almost all went to developers or Authorized Sales and Service centers. Actually I think Atari managed to sell more of it's CD Rom drive than Apple sold Lisa's

That would be true if it wasn't for the fact that at least 10,000 Amiga PPC upgrade cards have been sold so far. Granted, the current OS still runs on 68k, only using the PPC for the number crunching, but with OS3.5 that will change.

PPC has been available for Amiga for quite some time now, albeit an expensive option.

I'm sure you need all the help you can get.

->The front cover shows the folks who made the biggest investing mistake
->of all. One person in particular listened to her boyfriend(ex now?) to
->purchase $25,000 worth of Atari stock and ended up selling at below
->$1,000 when the stock crashed under the fine stewardship of the Tramiel
->clan... I wonder if one the Jihads are responsible for this...

Did they mention that quite a few people made lots of money, if you
judged the timing just righ? For example, right before the 64-Bit
Atari Jaguar was announced, stock was well under a $1.00. Not long
after, it peaked at around $15-16 or so (I don't have the exact
figures here). Obviously, if this "person" Had purchased $25,000 of
Atari stock before the Jag announcement, and then sold at peak later
on, they would have made the cover as one of the biggest investing
winners. Its all timing, Sinclap...

BTW, I notice you are still unable to correctly configure a Mac
newsreader. Doesn't Money Magazine inform you on the best way to
do this? ;-)

when will you admit you were wrong about trusting the Daily Tubby
regarding their ridiculous stance that you couldn't find an iMac anywhere
in Canada in April?

Hey, the iBook is good news for us - now, with the help of MagiCMac 6,
we now have access to a wonderful portable Atari solution, running our
programs faster on the platform faster and more efficiently than the
bloated pigware equivalents on the Mac....

>
> > Or, perhaps, he realizes that the jig is up and his kooklike insistence
> > that he's an "Apple Power Rep", despite his absolute refusal to post any
> > tangible evidence that he is, is now being put under scrutiny?
>
> Don't need to...

Sure you do. If you want us to take us seriously to your claims that you're an Apple Power Rep, you need to provide your credentials. Failure to do so only shows that you're only pretending to everything you claim to be, and confirms that you're a "kook". Would you trust someone to handle a trust portfolio if he didn't have good credentials? Would you trust an insurance agent, or someone claiming to be a police officer or bank manager, if he didn't, wouldn't or couldn't?

Since it has been proven time and time again that, due to the fact you are ABSOLUTELY CLUELESS when it comes to computers, as well as your many spelling gaffes and unprofessional conduct, we doubt you wouldn't get past the first question in the oral interview with Apple before you were given the gate...

> Plus I gave you clues..

nope, you only gave us the facts you are clueless, weinerhead. Posting web sites articles that only produce 404 results on their host provider does not constitute evidence. Or have you changed your service provider to chicken.net?

> Not like I want to post my 800
> extension than have to have disconnected due to the spamming by 'Chunks'
> and the Jihads...

see, TiFKAS is so out of it he fears phone calls from people who don't exist, like his imaginary friend "Chunks"....

besides, any calls would be to your boss, just to simply confirm that you are employed by someone related with Apple. What are you so afraid of, TiFKAS - that it'll be shown that you only attain the job level of assistant pencil sharpener?

Once again, you prove your lack of knowledge of the industry. The Radius Video Vision Studio was a pretty good low budget choice that ran on Nubus macs.. it actually was decent quality, especially when combined with the Telecast. Also, there were several other solutions based on the Targa 1000 and 2000 boards that people are still using today to create video..

Talk about what you KNOW..

Yes, and you evidently missed the post below:

Subject:
"Sinclap's Folley".. Final Cut Pro Review
Date:
Fri, 30 Jul 1999 18:44:42 -0700
From:
Particle Salad <psalad@earthlink.net>
Organization:
Yes
To:
sinclap <sinclap@my-deja.com>
Newsgroups:
comp.sys.mac.system, comp.sys.mac.advocacy,
comp.sys.atari.advocacy
References:
1 , 2 , 3 , 4

Well, let's see.. did you happen to see the new issue of "Newmedia?" You
know, the
one with a nice review on Final Cut Pro? Yea, they DID give it a very nice

review.. but read the last paragraph, Sinclap.

Oh heck, I'll type in in for you.

"Ultimately, the assertion that Final Cut will go head to head with Avid is
just
marketing bravado. The nonlinear industry only sells a few thousand units
a year,
and Apple lacks the professional dealer channel and support to link to
other
postproduction equipment. What Final Cut is geared toward are the several
thousand
serious owners of DV camcorders and the professionals working in smaller
studios,
who now have a compelling reason to think Macintosh for video editing.
(snip)"

One more quote from an earlier section:

"Unfortunately, Final Cut is not yet capable of real-time editing,
requiring
rendering of all transitions, titles, and graphics, which will limit its
use among
professionals, where time is money."

Taken from the latest issue of Newmedia, page 45, article "Final Cut Pro,"
written
by Jeff Sauer.

Unfortunately, you don't have enough self-worth to actually admit your
mistake..
but no problem. Game over, man..

Once again...You are in denial..

Don't forget that you had to add the cost of the Mac with the Radius
Video Vision.

For most people, A FireWire G3, Video camera and FCP will get there feet
wet and move on...They could not do this because the other solutions
were cost prohibitive.. Why has Avid dropped prices three times this
year?

Here we go again....That Daily paper stated that iMacs were in short
supply. Did not state that you could not find an imac...Danny 'Chunks'
boy....if your going to have credibility you need to get your facts

straight...

> Hey, the iBook is good news for us - now, with the help of MagiCMac 6,

Remember, the ibook is a Steve Jobs creation..You know your nemises that
was able to sell 2 million iMacs thus far despite your naysaying about
the imac...

To bad you will not beable to use the wireless airport under
Magicmac...What a waste..

> >

Yuk !?! :-(

Do you think the choosen slogan are bad ?
Would you like to suggest better ones ?
Would you like to suggest your own banners ?

Or do you think the whole idea is a waste of time ?

Looking at the site, I didn't think there were _intended_ to be funny.

Do you really think that everybody who advocates open standards must be
making a joke at Microsoft's expense?

--
When a clever man was stupid, he was stupid in a way a man who was
stupid all the time could never hope to match, for the clever man's
stupidity, drawing as it did on so much more knowledge, had a breadth
and depth to it the run-of-the-mill fool found impossible to duplicate.

I totally understand where people are coming from on this issue, and I notice that this is cross-posted to a wide variety of newsgroups addressing different OS communities, but I honestly think that it is the wrong track to take, both for those of us who are relatively new on the scene (I'm posting from the BeOS group) and those in the more established communities.

As soon as you define yourself solely in terms of another, I think you lose a lot. I've never been a fan of political campaigns where the whole push for a candidate centers around what's bad about the other candidate, and similarly, I always wince when somebody asks what should interest them about BeOS and people respond saying, "Well, it's not made by Microsoft!" If a product cannot stand on its own merits, then it's not much of a product, and I'm sure none of us would like to think that we are using our chosen platforms for that reason and that reason alone.

Here's an exercise we should all do :

Step 1 : Sit back and think only positive thoughts about your computer. Think of the thinks you like to *do* with it. Think about when you are happiest and what you're using your computer to do when that occurs.

Step 2 : Write a short essay to your favourite advocacy group explaining what you do with your computer that makes you happy. Do not use the word Microsoft, and do not compare your platform to any other platform. When composing this essay, try to express yourself using only positive language. Do not mention what you're glad your computer does *not* do. Mention only what you're glad it *does* do.

Step 3 : Lie back in bed before going to sleep, and work through this scenario -- Microsoft has disappeared from the world, along with all of their products. (This is not a fantasy of mine, just part of the setup.) Think about your platform in such a world. What defines it? What makes it unique? What drives its users and breathes life into it? What sustains developers' passion?

These are the kinds of issues and thoughts we should concentrate on if we want to succeed, or even if we want to have a healthy, happy computing experience. Spending your life hating

Microsoft is a waste of energy which could be used to forward
the positive cause of your platform instead. In the words of
Henry Rollins, "You're giving them too much of yourself." Hatred
is the path to the dark side, young jedi. Use your powers for
good, not evil.

4043. And you thought that Every was bad...

Newsgroup: comp.sys.atari.advocacy
Date: 1999-08-26 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-2608990901060001@ts7-37t-46.idirect.com>
Source record: 3006

This article is so full of technical inaccuracies and propaganda that I was almost to the point of screaming at my monitor when I was done reading it.

I'm referring to the article located at http://www.osopinion.com/Opinions/JohnPenner/JohnPenner2.html, titled "Why I Macintosh? A Year Later" [sic]. I'll start off quoting his words, and then presenting the facts, something that Mr. Penner doesn't seem to know the meaning of. Misunderstanding is acceptable, but propaganda, twisting of the facts, and out-and-out lying is intolerable. I'll quote various bits of the article, all in context.

"When buying a computer, many people just buy what is most popular. If you're not of the opinion that McDonalds is the best food in the world because a lot of people eat there, then you may understand the non-lemming-like concept that a system must justify itself on its merits, and not just by a popularity contest."

This analogy is no more valid then the Lexus(Mac) Yugo(PC) analogy. Analogies like this are worthless due to the author's lack of providing facts to back it up. Empty analogies are a common ploy by Mac users to try to present something as fact, when it's really a not-so-well hidden opinion.

"After using all three systems extensively, I can decidedly say that the Mac allows me to get my work done faster, and lets me do so in a highly customizable environment that is also elegantly implemented and a joy to use. There is a reason Mac users are so fiercely loyal to their platform, and it lies in an appreciation for good operating system design that is oriented towards a good end-user experience."

No, it lies in fanatical users [like yourself] who are obsessed with thinking that they're special just because they use a Mac. You may very well be productive on the Mac, but most are quite productive on Windows, thank you very much. Try speaking for yourself next time.

"My current machine is now an iMac. This "consumer" machine packs a lot of power in a simple form-factor that really has been well thought-out. After owning this iMac for about a year (since last aug.15), I have absolutely no regrets -- I am so happy with my decision to have got it, that I'm replacing a silicon graphics r5000 workstation (I've been running irix Unix for the last four years on it) with one."

The mind boggles.

"This will bring me a significant speed boost (MIPS r5000 200Mhz -> g3 333Mhz), and broaden the amount of software available to me significantly. I have over 300 pieces of application software for the Mac, but I only use a fraction of it regularly. Although I would consider myself a power user, I

run at most 5-10 core applications per day. To give you an idea of the applications that I use routinely on the Macintosh, I list them here:

- Netscape 4.5 - for web and mail; the first and the best."

Like I said, obsessed with obsolete technology. IE 4.5 for Macintosh is a better browser (even the rabid Anti-MS people at Mactoday admit this), and IE 5 Mac will be great. But Netscape? No thanks.

<Large snip>

"As I make my living organizing project directories, and writing documentation, I spend a lot of my time filing things. I like access to the filesystem to be a clear and direct one. The Windows system "hides" the real goings-on of what is happening to your filesystem with little icons on your desktop. The Mac actually gets you closer to the filesystem so that it doesn't need "wizards" to simplify it for you, because the filestructure is logical and clear down to the system level."

Filesystem wizards?! Whaaaa? Last I checked, I can access all my files through My Computer.

"When you see an icon on a Mac desktop, you know you're actually looking at a file whose directory path is: hard-disk/desktop folder/my file. With Windows, this is an illusion created by a shortcut somewhere on your hard disk."

The Desktop is actually a folder in C:\Windows\Desktop. So? Newbies won't even notice, and power users couldn't care less. In fact, the only people bitching about it seem to be people like you: misinformed Mac users.

"Likewise, on the Mac, you have an "Apple Menu Items" subdirectory. You put a file in there, and it shows up in the Apple menu. What you see in the apple menu (Microsoft ripped this off with the "start" menu several years later), is actually a listing of files in that directory. It is fundamentally elegant. With the start menu, your system is hiding more complex goings on because it isn't directly tied to something like what is actually in a file-directory."

"Complex goings on"? They're shortcuts to the actual files in their respective program folder. This is neither complex or hard to understand.

"This creates a disparity between what the user does and what actually goes on in the system, giving the user a false sense of simplicity when the underlying mechanism is actually too complex for most users to figure out, thus requiring "wizards" to do basic housekeeping."

I've got a question: Who cares as long as it works? Again, this isn't complex... and what the HELL do wizards have to do with any of this? Not a DAMN thing.

"Another thing I like about the Macintosh is that I don't need an "uninstall". It is an absurd notion on a Mac, because all the stuff the program needs is neatly filed into the application itself through

user-customizable "resources". This lets me change menu keyboard shortcuts, dialogue texts, and any resource an application might use. If I drag over an application from one disk to another, I have all the resources RIGHT THERE, and they can't get separated or lost from the program like with Windows (because you'd probably be missing a few critical DLL type files)."

This is a non-issue. Install/Uninstall wizards let you choose how you want the program set up, and with what options. Uninstall is also a simplified way of quickly removing a program. And I'd bet $20 that you haven't the faintest idea what a DLL is, let alone having a DLL problem.

"With the Mac, I copy exactly ONE file to a disk, move it to another directory on a different computer, click it, and it still runs every time. This is not possible with Windows, because you have all these niggly "DLL" files that are separated into different files all over the hard disk, and to track them down for all your applications is so complex that they had to invent an "uninstaller" to find and get rid of them all."

This has been addressed in another post. DLLs are not "separated all over the hard disk", they all have assigned folders and special places.

"This is simply because the system was badly designed in the first place. Because of resources, all the cryptic files that belong to applications are rendered obsolete, and also made more standardized. It also means that Macs don't need ".txt" or ".doc" on the end of filenames just to figure out what they are."

Again... So? And it isn't cryptic, as any regular user can tell you can "txt" means text, and "doc" means document. Sheesh.

"If you take these almighty important letters off the end of your filename in windows, the system is screwed, and can't even figure out what kind of file it is."

First off, you can't edit the extension "just like that", so your entire argument is extremely flawed.

"Is it a tiff image? A Microsoft word document or an html file? The system just can't live without that little extension stuck on the end of it. All these little filename extensions are kept track of in a "registry file".

Does anyone really care? Not me, nor anyone I know...

"The archaic disk-centric filenaming conventions of C: and A: and legacy dos 8.3 filenaming conventions will still plague Windows users for years to come. It is illogical and inefficient to kludge a disk-centric C:\ filesystem to adapt to a networked filesystem. Microsoft has had to make their whole OS stand on its head in order to make it work properly in a networked environment because C:\ is conceived of from a disk-centric point of view. Furthermore, Microsoft has had long filenames since Windows 95, but they still have convoluted filenames like: win.ini, autoexec.bat, and nddend.dll, and they always will."

Once more: Who gives a rats ass? So Microsoft didn't use 61 letters for naming those files... does this in any shape or form prevent me from naming my files longer then eight letters? The answer is no.

"Something you just don't ever have to worry about with a Mac. I have better things to do with my time."

Yes, like spouting off about "problems" that only Mac users bitch and moan about.

"One of the fundamental aspects of GUI design presented to a user is how they handle menus. On windows, you have a separate menubar in every single application window that you're running. This is a kludge. Instead of having five menubars in five windows The Mac simplifies this by consolidating them into a single menubar along the top of the screen. This makes it faster and easier to hit (no mouse overshoot to slow things down), eliminates clutter in the interface, and reduces ambiguity, as it changes context intelligently to eliminate sources of user error. (See Why Single Menubar? located at: <URLSnipped>"

This all depends on a user's preference. Although, most find the Mac's way of consolidating all the menus into one is restrictive and counter-productive.

"A few notes on the iMac hardware.

The iMac is really the next step in the evolution of computer hardware. Before, I had one plug for my keyboard, another plug for my mouse, a third plug for my printer, and a fourth plug for my zip drive and scanner--all of them incompatible and different types of connectors. If you value simplicity, you will appreciate the fact that all four of these connectors have been eliminated and replaced with a single plug. I now have: a mouse, keyboard, scanner, videocam, zip drive, and printer all hooked up to one standard interface. This makes things simple."

Welcome to the wonderful world of USB, brought to you by Microsoft, Compaq, and Intel.

" They have gotten rid of the clutter of ports on the back and replaced it with one universal peripheral plug.
It makes too much sense, but some people still prefer to have a bunch of incompatible ports and fiddle with IRQs and bulky 25pin connectors for their printer."

IRQs have less to do with peripherals (like printers), then motorcycles have to do with rock climbing. More astounding ignorance.

"On PCs, these legacy ports will take several years to phase out. On the Mac it's a done deal. Mac users are already over that hump and live in a world where they don't have to worry about it. It already just works."

Just because a new technology comes along doesn't mean that all previous technologies no longer work. Sure, I've got two USB ports on my computer, but does that mean I _have_ to buy USB peripherals? Well, if I had an iMac, the answer would be yes. Sorry, but my current devices work just fine. I

have no need to radically switch to USB.

"Furthermore fast (100baseT) networking is built into every Mac. This is an option on most PCs."

...And you can add a NIC to any PC for $25. And don't think that you aren't paying for that NIC in that beloved iMac of yours.

"The iMac moves away from the backward thinking disk-centric model of a computer to a network-centric model."

Sorry, that's incorrect. Removing a floppy drive from a computer doesn't make it a Network Computer.

"In five years it will be clearly evident how important it has been to include a fast network connection as standard equipment on every machine. One standard port for local peripherals, and one standard port to hook into the network. The engineers at Apple have made everything as simple as possible, but no simpler. This is the definition of elegant engineering."

Definition my ass. Apple was one of the last PC makers to adopt USB, and the iMac sure as sh*t ain't a NIC.

"The iMac's hardware design simplifies the peripheral and hardware I/O with a modern network-centric design, and provides a plug-and-play that works."

As opposed to Windows PNP that doesn't? Sorry, that'd be wrong, too.

"For those that need more performance, add a fast firewire bus as standard to the motherboard if you get a G3 pro tower. This provides a superb interface for high-bandwidth high-storage applications like video editing."

IEEE 1394 isn't Mac only. Sorry to burst your bubble.

<Picture of G3 processor next to Pentium II>

"The iMac contains a G3 processor. If you actually poke your nose into the box to look at the "engine" -- you will be struck immediately by the size differential between an Intel Pentium and a G3 chip. The Pentium is almost quadruple the size of the g3 to do the same function. How is it that that a g3 chip can process faster than a Pentium chip, be a fourth the size, and run cooler? Well, it has to do with better design."

First off, the Pentium in that picture has a oversized case to house the heat sink. If you'd take a look at the Pentium without the case on, you'd see that the actual processor is the same size as the G3. Even if the actual chip was bigger, who really cares? How does it effect me, as an end user?

"The Pentium chip uses a "complex" instruction set (cisc) -- it contains a lot of legacy work-arounds to accommodate archaic instructions going back to the first 8088 microprocessor used in the first PC in 1982."

Another fallacy, which shows that you know less about modern processors then Andy Rooney.

"This was a 16bit architecture (think lanes in a highway). Now the Motorola series of processors started out life with a simplified 32bit-instruction set (RISC). This allowed you to get more horsepower out of the chip with fewer parts. Less parts means smaller size, and uses less power. When Intel wanted to go to the Pentium, in order to remain compatible, they had to keep the old 16bit stuff in there even for newer generations of chips. This means they need more parts just to make a Pentium work around the old legacy stuff than Motorola needs to make their whole g3 chip. Because it has a less convoluted architecture to move data around in, a 250Mhz RISC chip does the same amount of work as a 400Mhz cisc chip, and is smaller and produces less heat to boot."

I really, really feel sorry for you if you truly believe that to be the truth. I'm not going to bother going into detail on this one. It's been debunked countless times by myself and hundreds others, but some ignoramuses like yourself fail to see the simple facts.

And they say public school is a success.

"This is why manufacturers have so much trouble making Pentium notebooks as fast as desktop machines. The Pentiums need more power and produce more heat than the RISC chips. That is also why you cannot buy a Pentium notebook that is as fast as apple's g3 notebook at any price."

Are you Steve Jobs? Your RDF looks an awful lot like his...

"Last, but not least. The Mac doesn't have a y2k problem."

Yep, you're Steve Jobs. No one else on earth could possibly be such a moron. It's people like you I like to smack in the face with a giant, smelly, fish called reality.

Are you kidding. Your telling me that "Safe Hex" is not suppose to be funny?
I understand the joke, but just did not find it humorous. The pictures of
Gates with pie on his face I found to be a little distasteful, but were an
obvious attempt at humor.

Actually, I must correct myself here, I did find a few of them to be funny.
Especially the "Who does he want to own today", "Where does he want to go
today" and "Sorry Bill, I choose where I want to go" as well as a few
others.

>
> Do you really think that everybody who advocates open standards must be
> making a joke at Microsoft's expense?
>

Although some are specifically supporting open standards, many of them are
simply bashing.

4045. VINTAGE COMPUTER FESTIVAL - VCF 3.0!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-08-28 00:00:00 UTC
From: siconic@jasmine.psyber.com
Message-ID: <7q7b9qvto5@news.psyber.com>
Source record: 3008

Parallax Inc. and Dr. Dobb's Journal proudly present...

The Vintage Computer Festival 3.0
October 2nd & 3rd
Santa Clara Convention Center
Santa Clara, California
www.vintage.org

For the third year in a row, the Vintage Computer Festival is back to thrill and amaze you with the history of one of the greatest inventions in all of mankind, the computer!

The Vintage Computer Festival is for YOU! We don't care which computer you think is the best. We don't care what machine you grew up with, or first fell in love with, or still use today. The VCF is a celebration of all computers and their history! Come share the joy of computing!!!

This year:

* More great speakers!
* More great exhibits!
* More great vendors with Cool Stuff to sell!
* More fun games and contests, including the Nerd Trivia Challenge!
* Tour The Computer Museum History Center!
* And of course, FREE STUFF!!

In short, plenty of stuff to indulge all your SENSES:

HEAR the speakers! SEE vintage computers! TOUCH them too!
SMELL their electronics! But please don't TASTE them!

"The mission of the Vintage Computer Festival is to promote the preservation of 'obsolete' computers by allowing attendees to experience the technologies, stories and people that embody the remarkable tale of the computer revolution."

If you haven't yet experienced the VCF, DON'T MISS THIS ONE!!!

Register Early and $AVE!

Register by September 15 and pay only $20 per person. That includes access to the entire event all weekend, including the speakers, the exhibit and the flea market. Kids 17 and under are admitted free, and as always, parking is free too!

To pre-register, send a check or money order to:

Vintage Computer Festival
4275 Rosewood Drive PMB#29-161
Pleasanton, California 94588

For ultimate convenience, please visit the VCF website for more information as well as a handy registration form ready to print.

http://www.vintage.org/vcf/register.htm

The Speakers

Horst Zuse

Horst, the eldest son of early digital computer pioneer Konrad Zuse, will be giving a lecture on his late father's machines and will focus on the computer businesses that Konrad later founded to market his ideas.

Jon Titus

Who can forget one of the earliest of kit microcomputers, the Mark-8? Jon designed the Mark-8 around Intel's 8008 microprocessor and wrote the construction article that appeared in the July 1974 issue of Radio Electronics--a milestone in microcomputer history.

Todd Fischer

Todd bought the assets of IMSAI after their bankruptcy and continued to manufacture and sell IMSAI products under the Fischer-Frietas Corporation. Todd consulted with MGM for the movie _War Games_ and, as a treat, will be bringing along for show and tell the actual IMSAI 8080 computer that co-starred in the film.

Michael Wise

Mike contends that his Sphere Computer circa 1975 is in fact the first integrated "Personal Computer". Some people think he has a valid claim to that title. Come hear his story and decide for yourself.

Ed Kramer

Ed has been creating computer graphics since the days when it was done using mainly analog video devices. Today he's a Sequence Supervisor for Industrial Light & Magic doing computer generated graphics and special effects for such films as "Deep Impact", "The Mummy" and "Star Wars: The Phantom Menace".

Jim Willing

Our admired and beloved VCF Celebrity, Jim will wax philosophic on various themes of stupendous relevance. This year, Jim will help the aspiring vintage computer collector restore their machines to operating condition with "Debugging for Dummies", and will also give you tips to help you revive ancient copies of your favorite computer games in "Dead Media Society".

Liza Loop

Liza heads up the LO*OP Center, a non-profit organization dedicated to improving education through innovative thinking. Liza introduced the first Apple into public schools in 1976 (in fact the first Apple 1, given to her by Steve Wozniak) and the world has never been the same since. Liza will be bringing along the Apple 1 and other historic machines for show and tell.

Eugene Kim

Eugene recently left Dr. Dobb's Journal as Senior Technical Editor to start his own consulting firm. He'll be giving a lecture on the history of free software, a very relevant topic considering the free-software movement is in full force in today's computing arena as evidenced by the escalating adoption of GNU/Linux.

Roger Sinasohn

Roger is an avid collector of early portable computers and will be giving a talk on the history of the Kyocera 85, a.k.a. the Tandy Model 100, a.k.a. the Olivetti M10, a.k.a. the NEC PC-8201A.

Doug Salot

Doug's research has uncovered what he believes to be the first "personal computer". Forget the Apple][, the Altair or even the Alto. Doug's pick as first PC goes all the way back to the 1950's. Designed by Edmund Berkeley, an unsung hero of computer history, Doug intends to win Berkeley the prominance and praise that he feels is much deserved by this virtually unknown computer visionary.

Plus!

Workshops by Parallax on their amazing little BASIC Stamp. Get a preview of this cool little device by visiting their website at http://www.parallaxinc.com.

For complete speaker information and schedules, point your favorite web page viewing software at http://www.vintage.org/vcf/speakers.htm.

The Vintage Computer Faire and Exhibition

This year, the Vintage Computer Festival exhibit will feature the exhibits of individual collectors, all vying to win first, second or third place in eleven categories, plus the coveted "Best of Show" award. The winner of the "Best of Show" ribbon will also win fabulous prizes.

This year, we want YOU to exhibit the pride of your collection. What better way to demonstrate your enthusiasm for your hobby than to be an exhibitor at the Vintage Computer Festival.

Exhibitor information can be found on the Vintage Computer Festival website (http://www.vintage.org/vcf/exhibit.htm).

The Vintage Computer Flea Market

Every year the best deals on vintage computer items can be found at the Vintage Computer Flea Market. Here are only a few of the amazing items sold at last year's flea market:

* Apple 1 (no, we're NOT kidding!)
* SWTPc 6800
* A rare computer by "the digital group"
* Morrow Decision 1 (S-100)
* California Computer Systems (S-100)
* Apple Lisa 2
* And much, much more!!

If you've got old computer stuff that you'd like to sell, there's no better place than the Vintage Computer Flea Market at the Vintage Computer Festival. Please visit our website for rates and regulations (http://www.vintage.org/vcf/vendor.htm).

The Nerd Trivia Challenge!

Hey trivia fans! Think you got what it takes to survive the Nerd Trivia Challenge? If you qualify, you'll be pitted against two other players in a battle to determine who is the undisputed master of computer history trivia. Answer the most questions correctly and you could walk away with $50 in cash plus some other nifty prizes.

Lightweights need not apply, this contest is geared towards the serious computer history enthusiast. For contest rules please visit http://www.vintage.org/vcf/ntc.htm.

Tour The Computer Museum History Center!

The Computer Museum History Center boasts the largest collection of historic computer artifacts in the world. Their collection includes rare, one-of-a-kind computers and artifacts that date back to the early part of the century and beyond.

A tour of the History Center's "Visible Storage" warehouse will be organized on Sunday, October 3. Tickets are limited and so advanced registration is recommended.

FYI: The History Center is on the move, and is thrilled to announce plans to build a permanent museum to be dedicated by 2007. You can help the History Center achieve its goal by becoming a member. Information about becoming a member of the History Center can be found at http://www.computer-history.org.

Meet Fellow Computer Collectors!

The VCF is the premier gathering for collectors of vintage computers. What better way to enjoy your hobby than by meeting other like-minded individuals to share stories and information about your computer collection. Register in advance by September 15 and save $$$! Visit http://www.vintage.org/vcf/register.htm for details.

Visit our Sponsors!

Without our sponsors, the Vintage Computer Festival could not be a reality. It is our wonderful sponsors that enabled us to bring you the Vintage Computer Festival year after year. Demonstrate your appreciation by visiting them on the web:

Parallax, Inc.
http://www.parallaxinc.com

Parallax manufactures the BASIC Stamp, a versatile microcontroller with a built-in BASIC language that is suitable for most any electronics and computer hobbyist project.

Dr. Dobb's Journal
http://www.ddj.com

Dr. Dobb's Journal is the oldest continually running microcomputer journal, in existence since 1975. It features monthly articles and columns geared towards the computer programming professional.

>"When buying a computer, many people just buy what is most popular. If
>you're not of the opinion that McDonalds is the best food in the world
>because a lot of people eat there, then you may understand the
>non-lemming-like concept that a system must justify itself on its merits,
>and not just by a popularity contest."
>
>This analogy is no more valid then the Lexus(Mac) Yugo(PC) analogy.
>Analogies like this are worthless due to the author's lack of providing
>facts to back it up. Empty analogies are a common ploy by Mac users to try
>to present something as fact, when it's really a not-so-well hidden
opinion.

The analogy *is* valid. Judge everything based upon its merits, not upon its
popularity, is what he's saying. That seems pretty valid to me.

>"After using all three systems extensively, I can decidedly say that the
Mac
>allows me to get my work done faster, and lets me do so in a highly
>customizable environment that is also elegantly implemented and a joy to
>use. There is a reason Mac users are so fiercely loyal to their platform,
>and it lies in an appreciation for good operating system design that is
>oriented towards a good end-user experience."
>
>No, it lies in fanatical users [like yourself] who are obsessed with
>thinking that they're special just because they use a Mac. You may very
well
>be productive on the Mac, but most are quite productive on Windows, thank
>you very much. Try speaking for yourself next time.

He's not saying you're not productive. He's saying /he/ is more productive
on a Mac. He *is* speaking for himself.

>"My current machine is now an iMac. This "consumer" machine packs a lot of
>power in a simple form-factor that really has been well thought-out. After
>owning this iMac for about a year (since last aug.15), I have absolutely no
>regrets -- I am so happy with my decision to have got it, that I'm
replacing
>a silicon graphics r5000 workstation (I've been running irix Unix for the
>last four years on it) with one."
>
>The mind boggles.
>
>
>"This will bring me a significant speed boost (MIPS r5000 200Mhz -> g3
>333Mhz), and broaden the amount of software available to me significantly.

I
>have over 300 pieces of application software for the Mac, but I only use a
>fraction of it regularly. Although I would consider myself a power user, I
>run at most 5-10 core applications per day. To give you an idea of the
>applications that I use routinely on the Macintosh, I list them here:
>
>- Netscape 4.5 - for web and mail; the first and the best."
>
>Like I said, obsessed with obsolete technology. IE 4.5 for Macintosh is a
>better browser (even the rabid Anti-MS people at Mactoday admit this), and
>IE 5 Mac will be great. But Netscape? No thanks.

Browser choice is largely a matter of personal preference. Both browsers do
what they're supposed to quite sufficiently.

><Large snip>
>
>"As I make my living organizing project directories, and writing
>documentation, I spend a lot of my time filing things. I like access to the
>filesystem to be a clear and direct one. The Windows system "hides" the
real
>goings-on of what is happening to your filesystem with little icons on your
>desktop. The Mac actually gets you closer to the filesystem so that it
>doesn't need "wizards" to simplify it for you, because the filestructure is
>logical and clear down to the system level."
>
>Filesystem wizards?! Whaaaa? Last I checked, I can access all my files
>through My Computer.
>
>
>"When you see an icon on a Mac desktop, you know you're actually looking at
>a file whose directory path is: hard-disk/desktop folder/my file. With
>Windows, this is an illusion created by a shortcut somewhere on your hard
>disk."
>
>The Desktop is actually a folder in C:\Windows\Desktop. So? Newbies won't
>even notice, and power users couldn't care less. In fact, the only people
>bitching about it seem to be people like you: misinformed Mac users.
>
>
>"Likewise, on the Mac, you have an "Apple Menu Items" subdirectory. You put
>a file in there, and it shows up in the Apple menu. What you see in the
>apple menu (Microsoft ripped this off with the "start" menu several years
>later), is actually a listing of files in that directory. It is
>fundamentally elegant. With the start menu, your system is hiding more
>complex goings on because it isn't directly tied to something like what is
>actually in a file-directory."
>
>"Complex goings on"? They're shortcuts to the actual files in their
>respective program folder. This is neither complex or hard to understand.

Then again, it's not as straight-forward as it could (should?) be. There's a lot of stuff inthere you can't move/alter. Why do I have to put up with a "Programs" item? Why is'nt the control panel more flexible (as in has a submenu)? Because Microsoft decided for me how it should look.

>"This creates a disparity between what the user does and what actually goes
>on in the system, giving the user a false sense of simplicity when the
>underlying mechanism is actually too complex for most users to figure out,
> thus requiring "wizards" to do basic housekeeping."
>
>I've got a question: Who cares as long as it works? Again, this isn't
>complex... and what the HELL do wizards have to do with any of this? Not a
>DAMN thing.
>
>
>"Another thing I like about the Macintosh is that I don't need an
>"uninstall". It is an absurd notion on a Mac, because all the stuff the
>program needs is neatly filed into the application itself through
>user-customizable "resources". This lets me change menu keyboard shortcuts,
>dialogue texts, and any resource an application might use. If I drag over
an
>application from one disk to another, I have all the resources RIGHT THERE,
>and they can't get separated or lost from the program like with Windows
>(because you'd probably be missing a few critical DLL type files)."
>
>This is a non-issue. Install/Uninstall wizards let you choose how you want
>the program set up, and with what options. Uninstall is also a simplified
>way of quickly removing a program. And I'd bet $20 that you haven't the
>faintest idea what a DLL is, let alone having a DLL problem.

Is it? Wait until you want to throw out a program that didn't include an "Unistall" option... Lots of stuff gets left behind, clutters up the system...

>"With the Mac, I copy exactly ONE file to a disk, move it to another
>directory on a different computer, click it, and it still runs every time.
>This is not possible with Windows, because you have all these niggly "DLL"
>files that are separated into different files all over the hard disk, and
to
>track them down for all your applications is so complex that they had to
>invent an "uninstaller" to find and get rid of them all."
>
>This has been addressed in another post. DLLs are not "separated all over
>the hard disk", they all have assigned folders and special places.

Let's see, I did a "Find File" on *.DLL just now on my Win98 machine. That produced a total of 1433 files, many of them duplicate, located in 93 different folders.

>"This is simply because the system was badly designed in the first place.
>Because of resources, all the cryptic files that belong to applications are
>rendered obsolete, and also made more standardized. It also means that Macs
>don't need ".txt" or ".doc" on the end of filenames just to figure out what

>they are."
>
>Again... So? And it isn't cryptic, as any regular user can tell you can
>"txt" means text, and "doc" means document. Sheesh.

Yep. And a lot of programs are constantly fighting over these extensions on my computer. One day MP3's open in Realplayer, the next they open in WinAmp after double-clicking them. Very annoying.

Oh yeay, txt and doc are easy. So what are "ini", "cpe", "wcm", "sfc", "sf0"? Not so obvious to the regular user, eh?

>"If you take these almighty important letters off the end of your filename
>in windows, the system is screwed, and can't even figure out what kind of
>file it is."
>
>First off, you can't edit the extension "just like that", so your entire
>argument is extremely flawed.

He didn't say it was easy. But if you do change or remove the extension, the system is screwed. And it can be done. I've had to do it lots of times when my Windows machine mistook a disk image file for some sort of picture again.

>"Is it a tiff image? A Microsoft word document or an html file? The system
>just can't live without that little extension stuck on the end of it. All
>these little filename extensions are kept track of in a "registry file".
>
>Does anyone really care? Not me, nor anyone I know...

I do. It sucks eggs. I don't want one file-type tied to just one application. On my Mac, a file opens in the application it was created with. On a PC, it opens with en application that is tied to the file-type through the registry. Not neccesarily the same app.

>"The archaic disk-centric filenaming conventions of C: and A: and legacy
dos
>8.3 filenaming conventions will still plague Windows users for years to
>come. It is illogical and inefficient to kludge a disk-centric C:\
>filesystem to adapt to a networked filesystem. Microsoft has had to make
>their whole OS stand on its head in order to make it work properly in a
>networked environment because C:\ is conceived of from a disk-centric point
>of view. Furthermore, Microsoft has had long filenames since Windows 95,
but
>they still have convoluted filenames like: win.ini, autoexec.bat, and
>nddend.dll, and they always will."
>
>Once more: Who gives a rats ass? So Microsoft didn't use 61 letters for
>naming those files... does this in any shape or form prevent me from naming
>my files longer then eight letters? The answer is no.

It gets annoying when you try to clean up your system. If I want to run a lean Mac OS without any networking, it's pretty obvious that I can throw out "AppleTalk", "Built-in Ethernet" and "File Sharing", several system files

that take care of the networking side of the OS. If I want to slim down Windows... Well, can I throw out "Cmd640x2.sys" without screwing things up badly? Or "Suhdlog.dat"? Certainly the filename is hardly an indication here. Heck, why not just number everything? As long as the names are unique within the folder, who cares, right?

>"Something you just don't ever have to worry about with a Mac. I have better
>things to do with my time."
>
>Yes, like spouting off about "problems" that only Mac users bitch and moan
>about.

Hmmm, if I only used a Mac, I wouldn't have these problems. As soon as I boot up my PC, I do have them. But I'm not a Mac user then, am I? Do you think I come up with these examples by looking at a computer in a store without touching it? Most Mac users have at some point used a Windows machine. And then there's the everlasting source of laughter, PC-magazines. Full of these same problems spouted by PC users themselves.

>"One of the fundamental aspects of GUI design presented to a user is how
>they handle menus. On windows, you have a separate menubar in every single
>application window that you're running. This is a kludge. Instead of having
>five menubars in five windows The Mac simplifies this by consolidating them
>into a single menubar along the top of the screen. This makes it faster and
>easier to hit (no mouse overshoot to slow things down), eliminates clutter
>in the interface, and reduces ambiguity, as it changes context intelligently
>to eliminate sources of user error. (See Why Single Menubar? located at:
><URLSnipped>"
>
>This all depends on a user's preference. Although, most find the Mac's way
>of consolidating all the menus into one is restrictive and
>counter-productive.

As you say, depends on user's preference. I do find that windows takes up a lot of screen-space for itself. but then again, screen-space is cheap these days.

>"A few notes on the iMac hardware.
>
>The iMac is really the next step in the evolution of computer hardware.
>Before, I had one plug for my keyboard, another plug for my mouse, a third
>plug for my printer, and a fourth plug for my zip drive and scanner--all of
>them incompatible and different types of connectors. If you value
>simplicity, you will appreciate the fact that all four of these connectors
>have been eliminated and replaced with a single plug. I now have: a mouse,
>keyboard, scanner, videocam, zip drive, and printer all hooked up to one
>standard interface. This makes things simple."
>
>Welcome to the wonderful world of USB, brought to you by Microsoft, Compaq,
>and Intel.

With hardly any sort of peripheral available until Apple adopted it.

>" They have gotten rid of the clutter of ports on the back and replaced it
>with one universal peripheral plug.
>It makes too much sense, but some people still prefer to have a bunch of
>incompatible ports and fiddle with IRQs and bulky 25pin connectors for
their
>printer."
>
>IRQs have less to do with peripherals (like printers), then motorcycles
have
>to do with rock climbing. More astounding ignorance.

IRQ's have nothing to do with peripherals? What do they have to do with, then? Last time I looked, every peripheral on my computer connects through a port, and every port has an IRQ assigned to it.

>"On PCs, these legacy ports will take several years to phase out. On the
Mac
>it's a done deal. Mac users are already over that hump and live in a world
>where they don't have to worry about it. It already just works."
>
>Just because a new technology comes along doesn't mean that all previous
>technologies no longer work. Sure, I've got two USB ports on my computer,
>but does that mean I _have_ to buy USB peripherals? Well, if I had an iMac,
>the answer would be yes. Sorry, but my current devices work just fine. I
>have no need to radically switch to USB.

Someone was gonna have to take that step. If you keep legacy ports on your computer, no peripheral manufacturer is gonna spend money on changing it's production processes, nor put a lot of effort in developing new technologies. The USB-boom after iMac's introduction showed that quite clearly.

>"Furthermore fast (100baseT) networking is built into every Mac. This is an
>option on most PCs."
>
>...And you can add a NIC to any PC for $25. And don't think that you aren't
>paying for that NIC in that beloved iMac of yours.

Yep. You can. But on every Mac in the store, it's built-in. Ready to go. No assembling, No opening the case, no driver-installing, no IRQ conflicts.

>"The iMac moves away from the backward thinking disk-centric model of a
>computer to a network-centric model."
>
>Sorry, that's incorrect. Removing a floppy drive from a computer doesn't
>make it a Network Computer.

Indeed, it doesn't. Offering built-in fast Ethernet, built-in networking support and network-bootability (diskless) does, however.

>"In five years it will be clearly evident how important it has been to
>include a fast network connection as standard equipment on every machine.

>One standard port for local peripherals, and one standard port to hook into
>the network. The engineers at Apple have made everything as simple as
>possible, but no simpler. This is the definition of elegant engineering."
>
>Definition my ass. Apple was one of the last PC makers to adopt USB, and
the
>iMac sure as sh*t ain't a NIC.
>
>"The iMac's hardware design simplifies the peripheral and hardware I/O with
>a modern network-centric design, and provides a plug-and-play that works."
>
>As opposed to Windows PNP that doesn't? Sorry, that'd be wrong, too.

Would it?. Me and my colleague all recieved IBM ThinkPads from work. With Xircom Ethernet/modem cards. I suppose I was lucky, because in my case it works. I've seen countless colleagues mess with that modemcard, where Windows asked for drivers, the floppy was inserted, the software was said to have been installed, only for Windows to ask for the drivers again after a restart. That's not plug and play, that's plug and try and plug and try, and still it won't work.

>"For those that need more performance, add a fast firewire bus as standard
>to the motherboard if you get a G3 pro tower. This provides a superb
>interface for high-bandwidth high-storage applications like video editing."
>
>IEEE 1394 isn't Mac only. Sorry to burst your bubble.

No it isn't. But it does come standard on every PowerMac, like he said. What's your point? Oh, on Apple computers it's called FireWire. That's because Apple invented it.

><Picture of G3 processor next to Pentium II>
>
>"The iMac contains a G3 processor. If you actually poke your nose into the
>box to look at the "engine" -- you will be struck immediately by the size
>differential between an Intel Pentium and a G3 chip. The Pentium is almost
>quadruple the size of the g3 to do the same function. How is it that that a
>g3 chip can process faster than a Pentium chip, be a fourth the size, and
>run cooler? Well, it has to do with better design."
>
>First off, the Pentium in that picture has a oversized case to house the
>heat sink. If you'd take a look at the Pentium without the case on, you'd
>see that the actual processor is the same size as the G3. Even if the
actual
>chip was bigger, who really cares? How does it effect me, as an end user?

The Pentium processor core is bigger than the G3's. And that does matter for reasons of efficiency, power-consumption and heat-generation.

>"The Pentium chip uses a "complex" instruction set (cisc) -- it contains a
>lot of legacy work-arounds to accommodate archaic instructions going back
to

>the first 8088 microprocessor used in the first PC in 1982."
>
>Another fallacy, which shows that you know less about modern processors
then
>Andy Rooney.

It does accept those instructions, though. The Pentium is still an x86
processor, based on the 8086.

>"This was a 16bit architecture (think lanes in a highway). Now the Motorola
>series of processors started out life with a simplified 32bit-instruction
>set (RISC). This allowed you to get more horsepower out of the chip with
>fewer parts. Less parts means smaller size, and uses less power. When Intel
>wanted to go to the Pentium, in order to remain compatible, they had to
keep
>the old 16bit stuff in there even for newer generations of chips. This
means
>they need more parts just to make a Pentium work around the old legacy
stuff
>than Motorola needs to make their whole g3 chip. Because it has a less
>convoluted architecture to move data around in, a 250Mhz RISC chip does the
>same amount of work as a 400Mhz cisc chip, and is smaller and produces less
>heat to boot."
>
>I really, really feel sorry for you if you truly believe that to be the
>truth. I'm not going to bother going into detail on this one. It's been
>debunked countless times by myself and hundreds others, but some
ignoramuses
>like yourself fail to see the simple facts.
>
>And they say public school is a success.
>
>
>"This is why manufacturers have so much trouble making Pentium notebooks as
>fast as desktop machines. The Pentiums need more power and produce more
heat
>than the RISC chips. That is also why you cannot buy a Pentium notebook
that
>is as fast as apple's g3 notebook at any price."
>
>Are you Steve Jobs? Your RDF looks an awful lot like his...

Hello? You don't have to be Steve Jobs to figure this one out... Let's see,
my ThinkPad runs a 300MHz Pentium II processor. For that, it needs two fans
to keep it somewhat cool. These are running all the time, sucking the juice
out of my battery, resulting in about 2 hours of disconnected computing. My
PowerBook G3/400 has a fan that I have never heard running yet, runs for
about 4 hours on a battery, or 8 on two batteries, and is a lot faster. In
fact, it is the fastest notebook in the world.

>"Last, but not least. The Mac doesn't have a y2k problem."
>
>Yep, you're Steve Jobs. No one else on earth could possibly be such a
moron.
>It's people like you I like to smack in the face with a giant, smelly, fish
>called reality.

Here's some reality for you. No Mac ever made has Y2K issues. It's a nice list, at http://www.apple.com/about/year2000/ , a long list of machines on one side, a long list of the word "Complies" on the other.

Now tell me why you posted this Mac/PC stuff in the Atari advocacy newsgroup.

4047. Re: [MS-bashing] New collection of anti-Microsoft banners

Keep on swinging your sentiment is heard around the world.
M$ had a team of people in the early to mid-nineties posting trash
on everybody but them, true or not they posted away. Too
few people these days are capable of thinking for themselves.
So they bought into the MikeySoft mind share.

I especially like sites that use that active x thing to close WinBlows
browsers.

He wanted sinclap to read and respond to it.. Thanks for doing so..

sinclap will be out of the office until next Friday and will be in
Chicago to get the marching orders for the rest of the year. Will be
checking email and voice messages periodicaly..

Yea, it's been killing you for a long time. See my post on the recent review if FCP.

Sinclap also wrote:

> Share what you know. Learn what you don't.

You're pretty good at the former, but clueless as to the latter.

You don't know about desktop video.. period. The more you open your mouth, the more you prove this, so I completely understand why you continue to ignore my posts about this.

There are plenty of places where you can learn, though.. you might start with the video lab at Apple, just off 280, where they compatibility test AVID, Media 100, etc systems. Email for the gentleman's name.

Before people go into denial, think about this: The Apple PowerMac G4's are so fast, that the US government doesn't allow them to be exported to certain countries because it is classified as a supercomputer. So there!

of course, since TiFKAS has shown no proof that he is actually an "Apple Power Rep", his claims are therefore suspect. Any moron can go onto Apple's web site and get info.

>
> These silver and whites are upto three times faster than the
> Pentiums...Of course a certain chunky person will be in denial...

of course, TiFKAS is once again talking about his imaginary friend who doesn't exist...

and funny thing, the people who seem to be questioning the speed of the new G4 are actual Mac users themselves in comp.sys.mac.advocacy, you know, the place TiFKAS is afraid to go to because he'll be burned beyond recognition.

Expect
> the reality distortion field to blind the reality...

yes, as done by the master of it - Steve Jobs, the main reason why TiFKAS' breath smells like shoe polish.....

so what - certain other things can't be exported to other countries
without certain checks and balances. I couldn't imposrt a 68882 chip into
Canada without signing some major forms proving my identity - is the US
government so paranoid that I'll sell it to So Damn Insane?

what I find interesting is that "Alien" (who hides behind a pseudonym
on Hotmail) is the only one who defends The iDiot Forever Known As
Sinclap's idiotic claptrap. Or is "Alien" TiFKAS' personal sock puppet?

Yeah, it's illegal to export beef from England into Europe, and you have to fill
out a lot of forms to export cars from one country to another, too. That's not
my point. I said it's illegal to export it to certain countries *because it has
been classified a supercomputer*. That's what I said. Spot the difference?

4056. TiFKAS and Daily Tubby - Historical Revisionism Fails!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0109991122350001@ts7-64t-27.idirect.com>
Source record: 3019

Recently, when I challenged The iDiot Forever Known As Sinclap
regarding his accuracy in dealing with the fact that there is no evidence
that the iMac is doing well in Canada by mentioning his championing an
article last March in Canada's least trustworthy newspaper, the National
Post (aka The Daily Tubby), he whined that he never said that the iMac was
sold out, but that it was merely in "short supply".

Oh, really, TiFKAS. Then why did you post this article on c.s.a.a under
the title "iMac Sold out Up North" back in March?

Want an iMac? Join the waiting list

Paul Brent Financial Post

Strawberry, blueberry, grape, tangerine, or lime.
No matter which is your favourite flavour, chances
are slim that there's an iMac computer waiting for you on the shelf at a
nearby Apple dealer.

Supplies of the bright, translucent iMacs are "severely
constrained." That's Apple Canada Inc. PR-speak for "sold out until April."

"The demand even exceeded what we thought it would be," said Dennis
Manning, an Apple Canada spokesman.

Grape, the most popular colour, has been consistently out of stock
since the product's introduction in January. Likewise for blueberry and
strawberry.

An enterprising would-be iMac owner might be able to track one down in
lime, the least popular colour.

The computers, which sell for about $2,000, are a hot commodity because they
do not look like their competitors' boring beige boxes, plus they are
configured to run applications such as games faster than IBM-based machines
that can cost twice as much.

"What Apple has done is dragged the computer sector into the mainstream
of marketing," said Mr. Manning, the spokesman.

<snip>

As you may remember, after the article appeared I did research
around Toronto and found iMacs at every store in plentiful supply, and at
many of them in ALL FIVE COLOURS. Indeed, one salesman at Computer City

told me that the article was "greatly overstated" regarding lack of iMac availability. I also found a large number of "Rev B." machinesthat were being blown out at fire-sale prices.

After that posting TiFKAS whined that they'd ALL be gone by March 15th. But when I retraced my steps on the 15th and discovered NO REAL CHANGE, TiFKAS had a major hissy fit.

Now why could that be? Could it be that at $1,899 CDN that the iMac is indeed overpriced and underpowered? And could it be that, rather than doing legwork like any good journalist should, the writer at the National Pest simply did a rewrite of an Apple press release?

TiFKAS, of course, then found an article from the Montreal Gazette and figured that because the paper leaned more towards the left that it would negate the damage caused by his championing the Tubby article. Close but no donut, TiFKAS - it merely was another example of another journalist who didn't do his homework (why only interview two small stores? Why not interview Future Shop and Computer City, the two major chain stores in Canada who sell the iMac, and who have many stores in Montreal and across Quebec? Why was, according to my brother, who works at a Mac store, Apple trying to get rid of Rev. B iMacs that were set up for the French-Canadian market that were glutting up their Cupertino warehouses by selling them at greatly reduced prices to other stores?)

so, it appears once again TiFKAS is in denial, and is once again trying to rewrite his own history—when it comes to his trolling and complete ineptitude towards computers - just like his claiming "I was never reprimanded by cedarnet.org for violating user agreements" (he was) or "I never called Calamus crap" (he did). And it also explains why he has suddenly stopped responding to Particle Salad after the Salad conclusively proved that TiFKAS has NO knowledge of how the video market works, has NO knowledge of use of video software, and therefore has NO credibility in this forum on this or any subject. Indeed, TiFKAS has been caught many times with his pants down to his ankles when his many claims about how Atari hardware and software "can't cut it" turned out to be stuff he made out of whole cloth, or proven to have been badly researched.

The conclusion? TiFKAS not only can't tell his ass from a hole in the ground, he also thinks he's an ostrich.

By the way, The Daily Tubby is under a constant watch by Canada's answer to Private Eye and Spy magazine, FRANK, who runs a bi-weekly column on the gaffs, mistakes and plagarisms on the paper run by right-wing kook Conrad "Tubby" Black, who is ever so much an idiot and bully as TiFKAS is (he once threatened to "horsewhip" a female journalist for daring to write an expose on his crony Brian Mulroney, and recently got into hot water when he wrote a letter to the Toronto Star in which he claimed that right-wing dictator and human rights violator Augusto Pinochet had gotten a "bum rap" and was really a great humanitarian - sh'yeah right, Tubby, and monkeys can fly out my butt) - indeed, Mr. Black is currently trying to sue our Prime Minister for allegedly blocking his chances to becoming

an English Lord, despite the fact that it's against the law for Mr. Black to accept such a position....

I fully expect TiFKAS to respond in a way that includes mentioning his imaginary friend "Chunks", a person who only exists in Mr. Sinclair's mind who is obviously a projection of his own vile personality, as well as the equally imaginary "Atari Jihads".

Sinclap, did you see the recent FCP review in MacAddict? Yep.. another great review. But guess what product they compared it to? AVID? No, they knew better.. they compared it to Premiere.

Why do you think they didn't compare it to an AVID? Probably because they knew that only a MORON with no knowledge of the video market would make such an idiotic comparision. If the shoe fits..

BTW, I'm looking forward to the G4 upgrade cards when they come out. It's too bad that the upgrade cards currently will NOT work in B&W G3s.. another genius Apple move, eh?

-Mark

and in another genius move, it now turns out that FCP is incompatible
with the G4! This is according to a Mac user on comp.sys.mac.advocacy who
was at
Seybold.

In defense of the G4, though, it's nice to see that Apple now has
proper math-coprocessing, and it's also nice that they've got a more
mature colour to the box (no more Smurf boxes! - guess we'll be seeing the
Smurf boxes going at fire-sale prices), and the clear handles are cool.

Too bad the Steve Jobs Reality-Distortion Field (tm) was laying it on
pretty thick - I mean, comparing the G4 to a Cray? Claiming that it's up
to four times as fast as the identical Intel? Even long-time Mac users in
mac.advocacy are questioning Jobs' tactics.

(Mr. Burns mode ON)

"You call THIS a SUPERCOMPUTER!"

(Mr. Burns mode OFF)

And using an analogy a step further, Sony has dropped the price of the
Playstation to $139. Using TiFKAS' yardstick, they're doing that because
they're scared of Sega's Dreamcast. (Actually, it's because the new
Playstation II is coming out next year).

And speaking of Sony, an issue of MacAddict has now officially pronounced
the Virtual Game Station dead after Sony won their injunction against
Connectix. This despite TiFKAS' crowing that Connectix would prevail in

court, and that after TiFKAS' previous prediction that Sony would licence VGS (which Sony said they would NEVER do). Next on Sony's list - bleem!.....

another great post, Mark. And one that TiFKAS will be too chicken to respond to...

Come on, be serious. The PowerMac is fast because of the G4 processor, so
if I put a G4 "soon to be here" upgrade card in a Amiga or Atari, these
will be classified as supercomputers also?
Supercomputer? my ***!! there's nothing super at all about the Apple, there
never has been and there never will be. All you get is a nice bubble full of
marketing hype. Once you switch on the flashy box it's the same old hat...

BTW: what the US government allows or not is ridiculous... If for example
Saddam wants a truckload full of G4 processors, he'll have them tomorrow.
As an exemple: I live in Belgium, and as a Belgian citizen have nothing to
do with the laws of the US Government. If I buy a G4 tomorrow, and decide
to sell it next week to one of the "certain countries" I'm not doing
anything illegal. Just "free trade" :-)

Apple, IBM and Motorola are Multi nationals designing and producing chips,
processors and parts all over the world. How do you control a Multi
national firm? What makes you so sure that the G4 is a 100% developed in
the US processor? Ever heard of India? I wouldn't be suprised if that
country in on the "certain list" also :-))
Times have changed, we live in a global community, ever thought about the
fact that your bank account is not administered in the US, but possibly
somewhere on a server in the Phillipines. That famous export list is nothing
more then a way to control economies and protect the home market.
To use the words of the Great Guru himself: "Let's think different"

Cheers from Belgium
Dennis

>Bill Gates has enough money to pay off Belgium's entire national debt?!?
Nah, I don't think so, our national debt is so gigantic, that even Mr.Gates will have to pass :-) he'll need to sell a whole lot more shitty OS's and clumsy Office suits before being able helping us out....
Somehow I don't think Belgium is in his good books either, since we called him welcome with a couple of fresh cream pies...

>MSIE5 was nice, integrated, responsive. All this on a P75 upclocked to
>100MHz. It did the web stuff, and stayed online for two hours without
>bombing out.
I have no idea what you've been using before this, but it must have been a pretty piece of lousy programming. On a humble Atari I manage to stay online for hours, without the software or hardware letting me down.
Comparing crap with crap doesn't make much sense does it?

>RISC OS has scrollbars that change size and fairly accurately reflect not
>only the scroll position, but the amount on-screen relative to the total
>amount. This message, currently, has a scrollbar half the size of the
>scrols slider space, because half of it is visible.
This sounds familiar....:-)

>Because Acorn created something good and usable on a budget that is
>probably laughably small in computer-company circles. And it wasn't put
>together by a team of coders several hundred strong.
And this is familiar also, one doesn't need the big mega firms for decent software, in some cases you're better of with a program coded by one man, who knows it inside out, then with the crap some firms produce.
A nice example of this is the Jinnee desktop compared to the famous Mac desktop. Once a person used Jinnee running under MagicMac he'll find it very hard to return to the clumsy out of date Apple desktop... Jinnee is coded by one single person, who even has a daytime job...

>Compare, for example, RISC OS (I'm posting from comp.sys.acorn.advocacy)
>and Windows.
This is familiar also :-)but that's what makes computing fun, even though you are on a system no one hardly knows, you can still do the tasks you need and in certain cases even better.
Whenever I mention that I'm a Atari user, people seem to think that I'm sarcastic, ironic or simply told a joke. They can't get it through their brainwashed Microsoft or Mac brain, that there are other systems available which have their own merits...

Cheers from Belgium
Dennis

PS: don't worry about our national debt, nobody over here does this. Next year when the Euro finally arrives, the rest of Europe will pay it off without realising it...:-)))

Still in denial?

Here is Robert Morgan's analysis...

http://macweek.zdnet.com/1999/08/29/rfithurs.html

Bulls and bears
OK, back to other companies' responses to the G4 boxes. I
don't know if the muffled screams I'm hearing is one of them being
mauled by that ravenous bear, or whether the bear's cub
just took a swipe at one of their backsides as they run away. We'll see.

First and foremost, let's talk about Scooter. Scooter
sells a lot of boxes as servers, even though its strong-selling
workstations
are in effect being used as servers in place of their
more-expensive brethren. And Scooter makes a lot of money from selling
them. Doesn't matter as long as they sell. Yet once the MP
G4 boxes are announced and start shipping, Scooter might have the
same problems that others are facing. Apple is raising the
bar as far as the price-performance ratio is concerned. If Apple ships
just a dual G4 and not the quad-four, G4 X 4 boxes, the
price-performance ratio will start rivaling a lot of boxes that cost
$40,000 or more. Especially given the extensibility of OS
X Server as well as the fact that it gets along with numerous Unix
versions. Toss in compatibility with Oracle's
applications, and a lot of eyebrows will go up.

Now, am I saying that Scooter is going to have serious problems in the near term? Of course not. But all things considered, would you rather spend $10,000 on a box whose performance is comparable to a $20,000 to $40,000 system, or would you insist on spending that extra money?

Next up is Avid. Remember my bearish comments and sentiments on Avid when it announced its forced migration to NT over the objections of its Mac customers? In my estimation, Avid basically slit its own throat with that decision. Well, Avid is now saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when it came to Mac offerings.

Neither Steve Jobs nor Apple wants to depend on only one vendor; when Avid balked, other solutions were developed as alternatives. (And I'm not only talking about Apple's homegrown Final Cut Pro.) Others will notice the opening and exploit it. Avid forgot that nature abhors a vacuum. And trying to say "Never mind," might be too little too late. Shorting Avid might have been prescient. We'll have to see.

On a related front, SGI is basically in the same boat. Some observers have characterized SGI's latest restructuring moves as a going-out-of-business strategy. I have a hard time arguing against that notion, even though the company is going to use MiPS in what you could call a "SGI Classic" and even if it uses Linux as the OS. About the only thing stopping a full-bore stampede away from SGI is that it was chosen as the development platform for Sony's PlayStation 2. My biggest problem with SGI: What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes.
Very possible. If not now, within the next year or so.)

What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions developed in-house and by its third-party vendors. When it first surfaced, this new direction prompted many members of the Greek chorus to start moaning, groaning and wringing their hands, until I informed them that just because Apple is focusing on digital video and audio publishing doesn't mean the company is washing its hands of traditional publishers. After all, there's
nothing stopping publishing pros from employing those solutions for traditional publishing. Most of the naysayers came in off

the ledge when I pointed out that the G3 boxes they were
currently using already had video capabilities, even if they didn't use
it.

The key point here is that Apple's product offerings will
soon surpass those of Avid and SGI when it comes to their
price-performance ratio -- and possibly on performance
alone. When Apple first launched Final Cut Pro back at April's
National Association of Broadcasters gathering in Las
Vegas, a lot of video pros said the software was good enough for about
80 percent of their work and that if future versions met
the features of Avid's solutions and offerings, then that figure would
rise
to about 95 percent to 100 percent.

Why am I focusing on Avid and SGI while discussing the new
G4 boxes? Because the majority of Mac users don't use them to
design and test nuclear bombs. Most pro markets use them
for "creative world"-type applications, including design and
publishing, video, and audio.

But what really got me laughing is that critics of Apple
and the Mac platform who had been insisting that the PowerPC chips
weren't fast enough because they didn't go to 500 MHz are
now downplaying the importance of speed. Is it because the G4
chips are not only in the 500-MHz range with the first
boxes shipped and that those 500-MHz G4 chips are faster than a
comparable Pentium III? Processor envy? Oh well. No
matter. Price-performance is what will sway the target market for those
G4 boxes, not whether they can sit there and tell others,
"My processor is bigger and better than yours." It's not the car but the
driver.

> > BTW, I'm looking forward to the G4 upgrade cards when they come out. It's too

Probably, yes. I'd really like to see that. But I'll keep my Atari's stock now.

>Supercomputer? my ***!! there's nothing super at all about the Apple, there
>never has been and there never will be. All you get is a nice bubble full of
>marketing hype. Once you switch on the flashy box it's the same old hat...

No it isn't.It's a well-designed case with a high-quality computer inside
running an OS that allows me to get my work done without crashing constantly.
Unlike a certain widespread OS from a certain Redmond software company.

>BTW: what the US government allows or not is ridiculous... If for example
>Saddam wants a truckload full of G4 processors, he'll have them tomorrow.
>As an exemple: I live in Belgium, and as a Belgian citizen have nothing to
>do with the laws of the US Government. If I buy a G4 tomorrow, and decide
>to sell it next week to one of the "certain countries" I'm not doing
>anything illegal. Just "free trade" :-)

I wasn't saying that the US export restrictions aren't ridiculous. I know that
people that want these machines will get them, one way or the other. There are
discussions going about raising the specs. All I said was that these
restrictions apply to the PowerMac G4, because by US government standards,
they're supercomputers. A stock Atari, Amiga, or any Wintel machine isn't.
According to these standards.

As for free trade, trade is not always as free as think. If you buy a G4 in
Belgium, wether or not you are allowed to export it to Saddam Hussein depends on
Belgian export law. There might just be some restrictions on that. Of course,
you could just do it anyway without registering the export, but that would still
be illegal.

>Apple, IBM and Motorola are Multi nationals designing and producing chips,
>processors and parts all over the world. How do you control a Multi
>national firm? What makes you so sure that the G4 is a 100% developed in
>the US processor? Ever heard of India? I wouldn't be suprised if that

>country in on the "certain list" also :-))

I don't think that IBM and Motorola have their processors produced in countries like India. Maybe a lot of more "mundane" chips are produced there, but not the cream of the crop. And I'll bet that their top designers are in the US also.

Apple has outsourced production of the iMac to companies in Taiwan and Korea, but the PowerMacs are being produced by Apple at Apple's factories in the US, Singapore and Ireland.

>Times have changed, we live in a global community, ever thought about the
>fact that your bank account is not administered in the US, but possibly
>somewhere on a server in the Phillipines. That famous export list is nothing
>more then a way to control economies and protect the home market.
>To use the words of the Great Guru himself: "Let's think different"

My bank account is most certainly not administered in the US, it's on a huge mainframe in Amsterdam. That mainframe runs software that I have written. Contrary to what you may think, if you have a bank account, it is probably administered on a big mainframe that is fully owned by the actual bank itself. Not on a big server in the phillipines. Banks are very (*VERY*) privacy-sensitive operations. They develop most of their software in-house and run it on their own mainframes.

>Cheers from Belgium

Imagine how fast that Fiesta would go ;-)
I don't know about the Atari upgrade cards, but on the Amiga front the G4 cards announced (avail October) have a graphics card option which is connected directly to the G4's bus. No bottlenecks.
Onboard SCSI means that there are no additional bottlenecks in that department either, and the addition of onboard PCI connector and USB ports is a bonus.
Add to that transparent 680x0 emulation built into the card as well and I can't see how such an upgraded Amiga would be slower then a Mac with a G4 processor.

Perhaps you could enlighten me?.

^^^^^^
sure, TiFKAS. Of course, that's a bad analogy - the Ford Fiesta being a
notorious rust bucket, practically all of them never survived their first
Ontario winter :)

really, why not simply change your name to Joe Isuzu and get it over with :)

BTW, it's spelled "chassis". Guess it'll be time for spelling class
after you graduate from remedial kindergarten....

4072. Adobe goes over to Dell! G4 Too Little, Too Late !

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-05 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0509991701060001@ts7-69t-35.idirect.com>
Source record: 3035

think Apple still has clout in the graphics sector? Think Again. Looks like Adobe has made their decision on what is cutting-edge regarding systems they can recommend - and just a few days after Apple debuted the G4 with their laughable "it's a supercomputer" FUD at Seybold. Looks like the Steve Jobs Reality-Distortion Field (tm) backfired. Any bets Jobs is having a hissy fit back at Cupertino?

this message was found at comp.sys.mac.advocacy....

http://www.dell.com/corporate/media/newsreleases/99/9909/1.htm

Dell Computer Corporation (Nasdaq: DELL) today announced that Adobe Systems Incorporated (NASDAQ: ADBE), one of the world's largest software companies, has selected Dell as its corporate standard worldwide for workstations and desktop PCs.

"The Dell Precision WorkStation 410 is great for our engineers, because it provides the power they need to create the award-winning graphics software our customers have come to expect. The benefit for our customers comes full circle now that Dell has begun to offer the Adobe Collections as an optional bundle with Dell Precision WorkStations," said Gerrard Rutter, vice president, Information Systems, Adobe. "For Adobe, Dell's OptiPlex G1 is a very cost-effective solution for general office work. By using DellPlus factory integration, Adobe is able to provide employees with systems that are fully configured and customized from the moment they open the boxes and plug them in."

Adobe has purchased more than 850 Dell systems for software development and general office applications. Systems are ordered via Dell's Premier PagesSM service, which provides customized, password-protected Web sites that Dell creates for institutional and business customers. Dell's Web site currently hosts more than 27,000 customer-specific Premier Pages.

and where I found it?

http://www.macaddict.com/

Guess when it comes time for Adobe to put its money where its mouth is, well . . . . .

4073. CompUSA laying aff 1,800, Apple losing major supplier?

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-05 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-0509991717270001@ts7-69t-35.idirect.com>
Source record: 3036

well, it looks like, despite TiFKAS' claims to the contrary, and
despite how allegedly well the iMac is selling in the states, InCompUSA is
in serious financial trouble again. And if they go, Apple can kiss their
only national supplier goodbye - and is kicking themselves after their
bully-boy tactics with Best Buy backfired.

as usual, found on comp.sys.mac.advocacy (the place where TiFKAS is too
chicken to tread)...

http://dailynews.yahoo.com/h/ap/19990830/bs/compusa_layoffs_1.html

Intersting, they're letting go 1,800 employees, or, as the article states,
half of their commercial sales staff.

I always wondered if CompUSA could get worst. It seems it CAN.

CompUSA always has tons of people in when I visit - why the layoffs?

I thought your imaginary friend "Chunks", who doesn't exist, was
supposed to be an equally imaginary Atari Jihad?

No fine print, bubba booey. It's also listed on CNN's web site as well,
major news story. Appears to be even WORSE than in that story, 1/2 the
sales staff have been canned, and several stores are having the plug
pulled. It's also become a major topic of discussion on
comp.sys.mac.advocacy.

The
> layoff occured in their instore corp dept. CUSA has streamlined to
> eliminate duplication in multi CUSA markets. According to the press,
> 1100 have accepted positions at the new corp call center in Dallas.
> CUSA store focus will be retail with additional staff.

now of course, we get the voodoo economics damage-control spin from
TiFKAS. No surprise there, as he may have a vested interest in Apple's
survival (of course, because he absolutely refuses to show ANY evidence
that he's an "Apple Power Rep" using as his pretence the lamest of

excuses, we can only surmise he could lose what little trolling capability
he has).

I'd suggest doing your homework and going to the CNN site yourself if
you don't believe me, troll-boy...

>
> As for BB, a missed opportunity.

yep, for Apple to have better national distribution. Too bad BB didn't
want their stores to act as Apple's warehouse for unsellable iMacs.

>
> Sent via Deja.com http://www.deja.com/
> Share what you know. Learn what you don't.

what TiFKAS knows - NOTHING. What he's learned - NOTHING.

Funny or... ?

Well, some are based on humourous statements (like the now famous
Bill Gates' "640k") and popular Microsoft jokes and one-liners.
Some are denunciations of Microsoft's bad practises.
Some are aimed to restaure computer history:
"No, Microsoft did not innovate the mouse"
"No, Microsoft did not innovate Internet"
Some were drawn to counter dis-information:
"You don't NEED Word to do word processing"
"You don't NEED Internet explorer to surf the WWW"
Some give hints on how to use MS-product in a more user-friendly way.
Others inform of the existence of alternatives and open and free standards.

All of them have a mockering touch of humour (the cream pie), but the
base idea is to spread a real message.

>>
>> Do you really think that everybody who advocates open standards must be
>> making a joke at Microsoft's expense?
>>

> Although some are specifically supporting open standards, many of them are

That's right.
```

It's a demagogic decision I took as I found out that bashing usually
proves to be popular, and jokes spread very fast. And to be totally honest,
I sometimes like that too ! :-)

Yes, as people here have knowledge (experience) of something else
than Wintel; and advocacy groups are probably the best places to
find people ready to defend alternatives to Wintel.

> but I honestly think that it is the wrong track to take,
> both for those of us
> who are relatively new on the scene (I'm posting from the BeOS
> group) and those in the more established communities.

Hmmm, maybe.

A banner campaign such the one I started at
<URL:http://www.ping.be/amigaphil/README.html> is probably not
the best way to declare that something is going wrong and we must
step in before it's getting worst, I must admit.
It's just my 2p.

> As soon as you define yourself solely in terms of another, I
> think you lose a lot. I've never been a fan of political
> campaigns where the whole push for a candidate centers around
> what's bad about the other candidate, and similarly, I always
> wince when somebody asks what should interest them about BeOS
> and people respond saying, "Well, it's not made by Microsoft!"

Yes, that's a weak argument.
But since, there's a point here:
Not using Microsoft's products at all give you a better chance
to not being tied to Everything Microsoft.

> If a product cannot stand on its own merits, then it's not much
> of a product, and I'm sure none of us would like to think that
> we are using our chosen platforms for that reason and that reason
> alone.

> Here's an exercise we should all do :

> Step 1 : Sit back and think only positive thoughts about your
> computer. Think of the thinks you like to *do* with it. Think
> about when you are happiest and what you're using your computer
> to do when that occurs.

> Step 2 : Write a short essay to your favourite advocacy group
> explaining what you do with your computer that makes you happy.
> Do not use the word Microsoft, and do not compare your platform
> to any other platform. When composing this essay, try to
> express yourself using only positive language. Do not mention
> what you're glad your computer does *not* do. Mention only
> what you're glad it *does* do.

Ok. But preaching in your own chapel won't help newcomers to have
a wider range of solutions to choose from.

How about people who think a computer is a machine that run Windows,
that Microsoft innovated the mouse and the GUI, that you need Word
to do word processing, that you need IE to surf the Web, ...

> Step 3 : Lie back in bed before going to sleep, and work
> through this scenario -- Microsoft has disappeared from the
> world, along with all of their products. (This is not a fantasy
> of mine, just part of the setup.) Think about your platform
> in such a world. What defines it? What makes it unique?
> What drives its users and breathes life into it? What sustains
> developers' passion?

Then pray that Apple won't take Microsoft's place and start to
re-build computer history and future for it's own profit.
Pray that your favourite development teams won't be buy-out and
stop writing applications and drivers for your machine.
Pray that nobody will try to convince you you need a Mac and MacOS
to be on Internet.

:-)

Think of what you can do to prevent any attemp to create a new
monopoly control on the computer industry.
Think of any help you can contribute to build better common
"languages" for the whole world to share the happiest computer experiences.

> These are the kinds of issues and thoughts we should concentrate
> on if we want to succeed, or even if we want to have a healthy,
> happy computing experience. Spending your life hating
> Microsoft is a waste of energy which could be used to forward
> the positive cause of your platform instead. In the words of
> Henry Rollins, "You're giving them too much of yourself." Hatred
> is the path to the dark side, young jedi. Use your powers for
> good, not evil.

Hating is not constructive, indeed. But closing our eyes (or worst,
closing other people eyes) on a menace to the freedom of the choice
we can expect to have in our computing experiences is not, either !

As I tried to explain in a previous post, this kind of campaign is
probably not the best way to put a spoke in Microsoft's wheel while they are
at the conquest of the world. But I hope this counter-propaganda will
bring curiosity to some unaware people:

"Why are all those people bashing Bill Gates ?"
"What's wrong with Microsoft ?"
"Why is this guy telling me my web site is not user-friendly ?"
...

> Firstly, I quite *LIKE* MSIE5 [...]

Nothing wrong here. It's your choice and that's good.
Hopefully, you are aware as to what to avoid to respect the choices of
other people.
(Hope your Web site won't bear a "Best Viewed with MSIE" logo ;-))

>>> A new collection of "Anti-Microsoft" Web banners is available at

> Have you read the Halloween documents yet? That says more than a bunch of
> banners ever could. Try thinking of the possible implications of some of the
> comments made... Storage+, comoditised protocols, all in the power of one
> company and one man.

Sure !
I would have build such an informative site if I had time and patience.
But other people do that better than I can.
The banner campaign is my humble attemp to defend the same cause.

> Philippe Duchenne is Belgian, yes?

Yes.

> Does he know that
> Bill Gates has enough money to pay off Belgium's entire national debt?!?

No I didn't. But I'm not surprised either.
What's the point here ? Does that make Bill Gates a holy man ?

Money does not wash more clean. Otherwise the drug mafia could use part
of its dirty money in donations to hospitals and gain acceptance and
impunity. (Er... ? ;-))

> Anyway, to describe something as "Good because it isn't MicroSoft" is worse
> than useless. Everything had merits (yeah, even Windows), the way to spin it

> actually inferring anything or directly stating "<product> is <condition>".

Agreed.
"Good because it isn't Microsoft" is an easy short-cut reply to those
"Best with Microsoft" or "Only possible with Microsoft" we are inundated with.

>>> Those are based on a "Microsoft FREE" seal (16 colors, Netscape palette
>>> used)

> slider space, because half of it is visible.

Would you like me to draw a "RISC OS has a better scrollbars handling than
Windows" banner and spread it outside the Acorn community ? ;-)

Who knows ? It could help to make a few people curious about what RISC OS
is.

> Win95's font smoothing works. But it is evil. To get MSIE to display a

> Additionally, the smoothing either blurs the text, or makes it look bold. Or
> both.

Same here (but that won't fit in a banner :-)).
And you could even catch the attention of a few more people.

> I think we can flame MicroSoft to hell and back for those omissions. Because

We can't blame Microsoft for everything they do. Microsoft *DID* many
good for the whole computer industry. But the way they are using their
power to erode other people's freedom to grab even more power is just
unacceptable.

The Mac Jihad 'Chunks' must of not read the easy to read print. The
layoff occured in their instore corp dept. CUSA has streamlined to
eliminate duplication in multi CUSA markets. According to the press,
1100 have accepted positions at the new corp call center in Dallas.
CUSA store focus will be retail with additional staff.

As for BB, a missed opportunity.

you find IE5 works? open more then 10 windows? - it crashes - I have PII333 etc and AMD 350 both machine crash like hell running Windows 98 - I had to type a letter on my A3010 the other day!

Its crap - Netscape if you got to use PC!

did you know that if you design a web site with HTML the right way it looks crap in IE!

So you have to put more code in for IE and then waste time, downloading etc - IE3 is very bad from this point of view!

As a RISC/Acorn user I thought you have pride in a OS that has small coding etc!

or I may be wrong

Adam

Hmm... IE5 doesn't like more than ~30 windows on my PII400, at that point
it tells me I out of memory.
BTW I doesn't crash even if I have ~30 windows open.

> Its crap - Netscape if you got to use PC!
>

Netscape crashs when I click on links, IE5 never did that!

I would say that you have a crappy designer, I can make a web site look
good with just about any browser. Though it may not look the same in each
one, browser offset is one problem and there are other problems. I problem
I have is not all browser (including different versions) do the same thing
every time.

Indeed. The APEC summit is here soon. Already kiwis cannot walk in
certain parts
of my home town without feeling like the Secret Service is watching.
Bill Clinton
passes through soon and its costing Kiwi taxpayers NZD$35 million to
host this
trade summit. Thats more money than I think NZ will get out of any free
trade that
is agreed to here. Its a case of 'free trade' so long as 'we get a cut
from it too'

Somehow the message is all fucked-up...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. Sorry to hear about the weather! Don't panic...we're expecting cold
gales and
heavy rain/snow overnight here to come through soon!! Another cold nite
at work
I can predict! bugger! ;^)

Because they probably couldn't sell gold for FREE. Always the majority
of sales in any retail outlet are made by a small percentage of the sales
team actually there...the rest are like limp, disused appendages...

Maybe the 'Apple Power Rep' made a big fuck-up, and the predicted sales of
his product went 'subterrafirma'?!...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> to me deleting its preferences folder while it was running <g>.

Interesting how experiences vary. A friend of mine is a graphic artist and uses a Mac. It's his machine that I fiddle around to familiarise myself with the interface. During every single browsing session I have done on his machine using Netscape, I've experienced at least one hang, necessitating a power down and up. I'm amazed at how resilient he is with hangs. I sat and watched him create a pattern using Photoshop and using it as a layer to enhance an poster. After half an hour at doing this his Mac hanged and he had to reboot and START OVER!!! I asked him how often that type of thing occurred and he said too often.

Intolerable!

I have since then advised him that he will not sell me on the Mac based on the Mac OS.

My brother and I were recently at the CompuUSA store in Lexington, KY. They did have a (small) Mac section, never found a sales rep, never even saw a customer there. Without exception, all customers were in the PC section while we were there. I know this probably isn't totally indicative of the Mac user base for that store but it sure didn't look good. It is also the very first time I got to play with an iMac and a G3. I absolutely loath the design of the cases on both. The G3's speed didn't seem to be too bad, but TBH, it didn't open windows any faster than my MiNT equipped, Nemesis powered Falcon.

Heh.

[snippety snip]

How much memory is fitted in the Mac, and how much is configured for the
virtual memory system? I've found that Netscape can sometimes lock the
machine up when it's getting low on memory.

IME MacOS is more unreliable than RISC OS in low memory situations.

There is a software licensing limitation of opening more than
10 sockets on NT Workstation. :-) This may explain this one.

You hit the nail right on the head. He allocates most of his
memory to Photoshop, 64 out of 96MB. He did say that his problems
tend to arise in low memory situations. This is not a good thing
at all.

I'd say that OS/2 is a champion at being stable on low memory
systems with it's GUI running and all. It purrs on 32MB's system
with many processes running. The swapfile is under serious
pressure and the system slows down but it doesn'y hang.

Gobs and gobs of RAM and a recent Mac running Mac OS 8.6 is the way to go
for stability. This machine (a G3/400 w/256MB of RAM) has _never_ crashed
in Photoshop. Other programs that have been unstable on every other Mac
I've ever owned (like Strata Studio Pro) are also rock solid.

In Opera I have routinely 40-60 windows open. Gets a little
tricky then, but works for the mostpart. Talk about efficiency
here. ;)

>And Mozilla is due out before the end of the year. Unlike IE and Netscape

Opera does that today already. And... if you know the test pages
on the Mozilla site, Opera loaded them all - simultaneously. For
a cute banner I once did, check the link from

I gotta agree with this statement. I pushed Warp 3 well past the limits once on a 486 system with 8MB of RAM. It ran out of space to expand the swapper and popped up a warning notification telling me so. It asked me if I wanted to terminate the app that tried to allocate the memory or "ignore" the situation. If I picked "ignore," it blocked the app attempting to allocate memory until more memory was freed up by other applications. The process then continued running merrily along with no problems. That was pretty classy. ;-)

I try to keep it under 5. Not because Netscape can't deal with it, but
because I don't like screen clutter. I should try to see how much Netscape
can take one of these days.

> > >And Mozilla is due out before the end of the year. Unlike IE and Netscape

The problem with that is it's not getting much use, so developing pages
that will only display in Opera doesn't do much good. The Mozilla engine
will be used in future versions of Communicator, and possibly in the AOL
browser as well. That'll give it a very sizable chunk of the market.

This is the beauty of Opera and the way it operates out of a
single window. Even the 40-60 windows are a bit ridiculous.

One could say the same for win9x/NT. NT works very well with a
lot of resources. Win9x gets pretty stable as well with good
memory. Doesn't say much about efficient low memory management by
these OS's.

Ugh! no thanks.

If RISC OS ever starts doing this (my greatest fear with the new window manager) I'm out of here.

MDI is evil, and would only make things worse here. Instead of having the
entire screen to arrange things on, I'd only get part of it (or I wouldn't
be able to keep things in the background visible). Sure, I'd be able to
hide all the windows in one click, but in Mac OS I can do that without
them all being contained in a parent window.

yep. and what is even more damaging, Apple is even admitting that FCP
won't work with the G4 in their Tech Support pages. Let's see TiFKAS try
to spin this one....

Too true. And the USA has the gall to promote 'free trade' with other nations including my home country of New Zealand, and then turn about face and slap a
huge tariff on New Zealand Lamb to protect its own lamb industry...the relevant connection with computer exports I see little similarity to that situation but
I cannot believe something 'Made in the USA' cannot be sold wherever Apple damn
well please...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

30 windows? Jeez. I thought I was bad.

> > Its crap - Netscape if you got to use PC!
> >
>
> Netscape crashs when I click on links, IE5 never did that!

On the Mac the situation is somewhat reversed. IE 4.5 is the only program
that can reliably crash the OS on my G3. Netscape has crashed all of two
times ever, leaving the OS up both times. And one of those crashes was due
to me deleting its preferences folder while it was running <g>.

> > did you know that if you design a web site with HTML the right way it

> I have is not all browser (including different versions) do the same thing
> every time.

I've had correctly written HTML that works just fine in Netscape and iCab
and is actually compliant with the HTML 4.0 spec(!!!) render incorrectly
in IE 4.5 for Mac and render incorrectly in a totally different way in IE
4 and 5 on Win '98. Hopefully MS will fix this in IE 5 for Mac this fall
and whatever the next release for the PC is. At least IE doesn't support
the <BLINK> tag :-)

And Mozilla is due out before the end of the year. Unlike IE and Netscape
it'll strictly adhere to standards.

> browsing. [...]

Not for everyone.
Beginners usually "learn" how to build a Web site by looking at the source code of other people's pages. They then assemble pieces of HTML to make it look good with their own browser ("It works here. If it does not work for you, then your browser is wrong.")

Users of Outlook Express often send uselessly (garbage-) inflated mails just because they don't know it's a default "feature" of OE to send mails "layouted" with (misused) HTML, and that they can set it to normal text.

Let's not talk about all those .doc attachments sent without even knowing if the recipient is using Word as word processor.

... and so on

>> "Good because it isn't Microsoft" is an easy short-cut

> Not really. We should be good on our own merits, rather than "We're good
> because we aren't...".

> "Vegetarianism is good because we don't eat meat". It doesn't say much, does
> it?

Ok, I learn the lesson :-)

>> And you could even catch the attention of a few more people.

> Of just use font-drawn stuff on my website and wonder if people notice?

Banners are easier to manipulate with just standard HTML and CGI if you want eg to display them at random or create a banner network.
(<URL:http://www.ping.be/amigaphil/SBill.pl> for a Perl example).

On the other hand, it becomes less easy if you wish to create a banner dynamically from a given text (but tools exists to do that too).

When I hit a news site like slashdot, I'll open-in-new-window each link
that looks interesting then go through them one at a time. I can
easily exceed 30 windows, if it is a busy day.

I can quite easily manage 20 Opera windows, while I'd probably have to run looking for a multiple desktop simulator if I were to try that with IE or Netscape. I've seen it done with about a dozen IE windows and the taskbar was a mess and confusion. Make sure, it's the only thing that you're doing at the time.

I wouldn't particularly push for this type of thing globally but specifically for browsing it's a useful principle. It also works very well for editors and word processors, not to have a new window open for each document.

What if you browse in full-screen as I and many others do, then
you're already using all the screen estate. I'm not trying to
convert you but the method does have it's advantages.

With this method, I don't have to spend time arranging things
either because there's no arranging to be done. I can get on with
it. :)

By the way:

Right click the windows taskbar or hit winkey-D and you'll see
that you can minimize all windows in Windows as well. You can
also cascade, tile horizontally or vertically.

Most overestimate the Mac interface. I see no real advantages of
using it.

It can be done very rapidly with Opera as well, since the
keyboard shortcuts are beautifully thought out.

Shift+left mouse click on the URL opens the URL in a new window,
then you hit the '2' key which brings you back to the previous
window, select another link and open it in it's own window, hit
'2' again and so on ......

I love it.

who is developing pages that _only_ display in Opera? no-one as far as I
can see.
that would be like developing pages that can only be seen by IE.
suicide.

I'd like to see Opera for the Atari, and have suggested that since they
are
developing a Linux version, that they keep one eye on BSD compatibility,
cause with that little extra effort, then can have a browser that will
work on
any Atari for almost no extra (programming) cost. BSD Unix -> MiNT

Fair enough...

> If it's not a waste of your time, would you tell me what it's
> like?

Sure...

All the desktop centres round the Filer (like windows explorer but FAR
nicer to use (and you have to use it to know that))

You have an icon bar at the bottom of the screen, about twice as high as
the windows one, on which hardware appears on the left and side (ie. drive
icons, printers, the ROM filesystem, CDROMfs's and pseudo-filesystems)
On the right hand side, there is a task manager, and a display manager
(RISCOS has always been able to change screenmode dynamically.)

You load applications by navigating through filer windows, and
doubleclicking on the app. one can also "symlink" them on the "desktop"
once loaded, applications typically place a small (36x36 pixel) icon on the
icon bar (although they dont HAVE to) and sit there.

If you click on them, they open a new document window or their main window
if they only have one window (ie. are not multi-document editors).

pressing menu on an iconbar icon for an application gives a standard menu,
with info at the top, quit at the bottom, and anything else in between.
pressing menu on a hardware device icon produces appropriate menus too (eg.
floppy->format->Otherformats->DOS1.44M) (as you can see, menus are
hierarchical and context sensitive.) "menu" is the middle mouse button. We
dont have "menu bars" on windows ad pressin "menu" anywhere in the window
produces a menu.

the right mouse button is used to "modify the actions of the left one eg.
left click on close = close window. right click = close and open parent.

Yes he has, because RISC OS does it the same way as IE. That is one
window per document.

Yes, but RISC OS has much much MUCH better ways of managing the windows.

It works fine with SP5 and doesn't seem to have problems with the
other apps that I run. I don't use XFeel so I can't comment on
it. What's XFeel anyway? :)

It's not just typing in.

Say for example, you're copying _some_ files from one window to another window (under Windows). When you drop the files in the destination window, this window pops to the front. If it obscures the source window, you've then got to do _something_ to get it back.

With RiscOS, you can drop the files in the destination window, and keep the source one at the top. So long as _some_ of the window pane is showing, you can drag the files there.

In addition, you can drag windows from _behind_ the stack, as though it were a sheet of paper, so you can see a _bit_ of it, and then put it back again. Again, without the window popping to the front.

OTOH, this does have _one_ disadvantage, in that it's impossible (without the use of a 3rd party patch) to brind a window to the front unless its title bar or resize icon can be seen.

The patch I use allows you (when pressing ALT) to drag a whole window. When clicking the left mouse button, it brings it to the front of the stack. Using the right bouse button, it leaves it in the stack (depth wise) but allows you to change its position.

You reply int the newest window, close it, click on "Post" (or your local equivalent!), and then you're back with fewer windows.

The only things that are MUCH better about RISC OS are being able to
push windows to the back, and no auto-fronting. Everything else is just
trivial niceties. And it doesn't even provide you with a way of listing
the windows so you can jump straight to the one you want without having
to hunt for it (unless you get some 3rd party add-on). RISC OS really
isn't special in terms of window management.

Opera displays pages according to the W3C standard. Period. So if
they look good in Opera, I should expect them to look good in IE
and NS, too, so I don't have to go through the nightmare of
checking with either of them for consistency. But as NS/IE don't
stick to the standards or have a lousy interpretation of it (like
NS re: CSS), this is unfortunately only a dream.

>'2' again and so on ......

My favourite (and incidentally my invention, too) is
Shift-Ctrl-Click which opens a browser window (inside the MDI) in
the background. In practice - and now you SDI evangelists listen
carefully ;) - this translates into this:

I go to a search engine or link listing and just S-C-click
until I no longer want more links opened. Now while I S-C-click,
my window with the search engine results or links ALWAYS remains
on top, and while I skim the listing for more interesting links,
the others open in the background just as one would expect this
from an efficient browser.

I claim to be at least 3-4, sometimes even 8-10 times faster, IOW
I get my work done much quicker with Opera than with any other
browser. And trust me, I DO browse a lot, mainly for my new site
at http://www.inspiredmind.com

But this is getting off-topic now.

Cheers,

Helmar

The main difference is that it is /far/ easier to manage window positions on your desktop. For one thing windows don't automatically come to the front when you click on them, so you can be typing something into one window, whilst monitoring what's going on in another.

Programs often use multiple windows without it being a problem. My mail/newsreader, for example; when first loaded, you get a small window which lists your mailboxes. If you double-click on one, a new window opens which contains the messages inside it. If you double-click on a message, it is opened in another window. If you click on 'reply', another window is opened. You'd think all this would make the desktop very cluttered, but it doesn't.

I've never quite managed to work out why people discount third party addons.
OK, so they're not written by the OS author, but that doesn't necessarily
mean that they're any less reliable or integrated. All my third party addons
together come to less than 1MB, which is still a fraction of the size of
Windows.

Finally I hear something advantageous. :) How often does someone
wish to type something and they can't see what they're doing. It
sounds more geeky than anything else.

Quite often actually. I do this all the time. It's not typing blind, but
merely the window you're typing in is underneath another window (say an HTML
source code window or graphics editor window) but with the actual text part
visible - ie the windows are overlapping.

I often have a paintshop type image on the screen and can obscure the image
part with another window that I might be copying text out of to enter onto
the bottom of the image. I thus want to type on the bottom window without
affecting my stack of windows on top.

All sorts. I use !OpenFiles to keep tabs on which files are open by the system (and close specific ones if I wish), WimpBar to give me drop down menus along the top of the screen, LineEditor module to give me a Linux style command history from the CLI prompt, 3DPatch to give a 3D feel to dialogue windows, LongFiles to give long filenames on pre-RISC OS 4 machines, CoolSwtch to switch between application windows (bit like CTRL TAB on Windoze), DirMenu to give a filer tree on the title bar of filer windows - to name a few. These in total only add a couple of hundred K to my system memory usage.

Hmmm. I see. I consider myself a geek by my standards so I'm glad
that you were't offended by the use of the term. The beauty of
windows is that there may just be some utility around to give you
this ability. One OS will not have all the advantages and quirks
to satisfy all users.

Good for you that you happen to have an OS using that has this
useful feature for you out-of-the-box. :)

Is this windows that you are speaking about or RiscOS?

For my NT system, I use Perfect Screens to give me multiple
desktop functionality, Clipcache to improve my clipboard
capabilities, Getright to improve my ftp and downloading
capabilities, rascal pro to better monitor my internet
connections and keep them active to avoid unwanted
disconnections, Salamander to improve on explorer, BeDeamon as a
task launcher and many other small utilities that I use as
needed. :)

I'm only able to get Apprunner working, but it may have something to
do with me not having glibc 2.1 (They've dropped support for 2.0).

I've heard good things about the Win32 builds, they even have Java up
and running reasonably well (So it's already better than NS 4 ;)).

Right, this is all good. In theory. I've seen pages that render correctly
in iCab (which is also rather standards compliant), but don't render
correctly in IE.

however, this is rarely a problem, and even when it is theres often a
convienient alternative (ie, reopen a directory, and it pops to the front)

I just did what you just described with my NT system here. I
opened clipcache which opened in front of my newsreader Agent.
The clipcache window is smaller than Agents so the editor window
for Agent is partially visible. I select a block of text in
clipcache and drag'n'drop it into agent's editor. Agent's editor
window didn't pop up to the front as you claimed it would.

> In addition, you can drag windows from _behind_ the stack, as though it were

Now *that* I cannot do. :)
It offers a minor advantage but not significantly so.

> OTOH, this does have _one_ disadvantage, in that it's impossible (without the
> use of a 3rd party patch) to brind a window to the front unless its title bar

Now that shortcoming, I couldn't tolerate and I'd not give that
up for the advantage you stated previously.

> The patch I use allows you (when pressing ALT) to drag a whole window. When

The Nuon systems are being sold as DVD chipsets, as everyone knows.
This chipset will ship with new DVD players soon. One can surmise,
around or after the Xmas season.

In the meantime, there isn't much to advertise because the hardware
isn't out there yet.

So do you think it's worth telling Netscape about a rendering bug in the old engine that's in NN 4.6? It only affects the windows version though.

Regards

Anthony

First of all, nothing is off-topic in cola at least...;-) Also if any developers for the various platforms (look at the newsgroups...) are watching, people describing features they find useful - and more importantly - why they are useful will be very helpful to them when creating their own programs.

It rather like those useability tests, but without the expense and the subsequent marketing chest-beat.

It allows you to have the focus follow the mouse pointer rather than having to click-and-raise-to-focus. Like in X. The focus behavior of Windows really bugs me, and I guess it bugged some of MS's programmers too as they released a tool to fix it.

The only problem I've noticed is this new focus behavior confuses Netscape's Bookmarks.

We are creating a (free) massively multiplayer Internet game site and are interested in talking to people who have either:
1. already developed (or are near completion of) a massively multiplayer, shoot-em up kind of game;
2. developed/are near completion of/orare interested in developing (we have some cool ideas about the design of various games) classic, single-player oriented arcade games converted to multiplayer.

Thanks!
Frank Lyles

Running 95OSR2 with IE5, if I have the following showing.

```
---------------
| |
| |----
| 1 | |
| | |
| | |
--------------- |
| 2 |
| |
------------
```

I want to copy selected files piecemeal from window 1 to 2. I select the files in 1, drag them to 2. Window 2 then pops up in front, meaning I've got to do another action to get window 1 back in front.

In Risc OS

>
> > In addition, you can drag windows from _behind_ the stack, as though it

It suits the way I work better than the Windows way.

I've got 2 PCs and 1 RiscPC, and I find the Windows way of managing windows clunky compared to Risc OS

> > OTOH, this does have _one_ disadvantage, in that it's impossible (without

>

Most of the time, you find that because of the way Risc OS handles the windows it isn't a problem, because instead of having a huge MDI window in the way (say in the case of a graphics package), you can have all of the tool windows jammed against one edge of the screen, the artwork at the other, and still be able to see the desktop.

<snip>

> > > Oh? Then what happens?
> > >

>
> I do this in windows. I don't see the difference.
>

The difference is that in Windows, all of the above are in the _same_ MDI "big" window.

Take for example Outlook Express that came with IE5. You've got the "groups" down the left hand side. The right hand side contains (at the top) the threads, and at the bottom, the message (this is the default setting that I kept because it irritated me less than the alternatives).

OK, you can have the current message in a separate window, but I personally find this a waste of space.

The setup I have ATM is that on the top LHS, I have the groups window. Over the top of this, I have the threads window - after all, if I'm reading a news group, I've no desire to see what other groups I'm subscribed to, or how many messages there are in them.

Slightly overlapping this again is the current message window. Similarly, I've got no particular wish to see the time/date that the message was posted, but I can still see the list of threads to the left of the message window.

And all of this time, because I've not got the MDI window in the way, I can still see my pretty desktop background/wallpaper.

I personally find the general Window handling of Risc OS to be an order of magnitude better than Windows.

Sure, Risc OS is not too hot under the bonnet, but ATM, the news/email software is IMO far better than anything I've seen on Windows. I've tried Turnpike, Eudora, Free Agent, Netscape Messenger and Outloook Express. If anyone has suggestions, as the Ferengi say, "I'm all ears!"

TBH, it's mainly the Messenger/Newsbase combination that's making me stick with Risc OS. It's free, powerful, has built in POP3, SMTP and NNTP servers, and is far neater than anything else I've seen.

Peter

Aha! Thanks for settling that. I feel FAR better that Tom Harker ripped
me off with the end result being a lonely alien returned to the
motherland. I wonder if that type of "donation" is tax-deductible?? Oh.
What a minute. That train of thought could wrongly lead someone to infer
my 2 "preordered" CatBoxes had actually been produced in the first place
at some point! Just think of the 3 Dreamcast titles I could have picked
up yesterday with the $150 I'm out.

Well, it won't do *exactly* what you want, but if you use the X-Mouse
features that are included in Win98's TweakUI, you can set it so that
the mouse gives focus without clicking, and you have the choice of
whether or not the focusing raises the window to the front. Dropping
files on an explorer window still acts like clicking on it, though,
either way.

See, I actually much prefer Be's way, which doesn't require me to have two windows at all. I just select the files I want to copy, right-click, and slide through the destination tree to the location I want.

As a fallback, I like the Windows method where I select a bunch of files that I want to copy, select edit/copy, navigate to a destination, and choose paste.

In the end, of course, this is all a matter of personal preference. No matter what method you choose, someone will prefer another method better, regardless of how arcane the other method may seem to you.

>It suits the way I work better than the Windows way.

This is a very fair statement because you indicate that it suits the way you work better. Everyone works differently. I think that not realizing this is one reason why so many silly arguments about things which fall into the realm of 'preference' start. ;)

Whether this happens or not in Windows is up to the designer, of course. While the scenario you describe above is more common and popular, I know of several Windows programs which operate by opening bunches of totally independent windows.

On the other hand, on Be (I keep mentioning Be only because this is still being crossposted to comp.sys.be.advocacy, among other groups), you can not only have bunches of windows, but you can slide their tabs over to whatever position you want on the top of the window so that you can make your windows be like cardfiles, if you like to use multiple overlapping windows. Also, the desbkar *and* the keyboard task switcher both work hierarchically, letting you choose the parent app first then drill down to a specific window, whether it's shown or hidden at the time (and with highlighting identifying

which are currently shown and hidden). Myself, I don't use either of these features all that much because I much prefer to just sprawl myself in non-overlapping arrangements across many desktops, and switch between them. This works similar to Linux, except that the number of desktops is selectable by the user (is it in Linux? I don't know. I guess it would depend on your WM.).

"Usable" is such a vague term. I take it you mean "it's crap, but
it's all the poor Linux users have" ;)

I wrote a Tracker add-on for BeOS called XCV to do that in BeOS. It needs
some work, but it works pretty well. BeOS is so easy to program for.

Actually Perfect Screens has a toggleable feature for this but I
have disabled it. I hate when my mouse accidentally brings a
window in focus. I've gotten used to the concept that the mouse
simply being in a particular location will not affect window
focusing. My usual habit when I open a program like Agent here is
to get the mouse pointer out of the way of the window since I
operate Agent solely with the keyboard. I also get the mouse
pointer out of the way of my editor window while typing. Suppose
the mouse pointer accidentally falls on one of the background
windows (this is very common for me because this doesn't normally
concern me since it doesn't affect anything by default) it pops
up uninvited.
Grrrr!

Anyway, different strokes.

Of course the cursor would hide itself as soon as you started typing in a
well designed interface. Mac OS does it. I'm sure some other OSes do as
well.

MS always misses the little touches when stealing ideas from people :-P

I guess you did not see my response to your desparation...

Here is a snip of what Robert Morgan from Apple Recon thinks of the Avid
saga...

http://macweek.zdnet.com/1999/08/29/rfithurs.html

Bulls and bears
OK, back to other companies' responses to the G4 boxes. I
don't know if the muffled screams I'm hearing is one of them being
mauled by that ravenous bear, or whether the bear's cub
just took a swipe at one of their backsides as they run away. We'll see.

First and foremost, let's talk about Scooter. Scooter
sells a lot of boxes as servers, even though its strong-selling
workstations
are in effect being used as servers in place of their
more-expensive brethren. And Scooter makes a lot of money from selling
them. Doesn't matter as long as they sell. Yet once the MP
G4 boxes are announced and start shipping, Scooter might have the
same problems that others are facing. Apple is raising the
bar as far as the price-performance ratio is concerned. If Apple ships
just a dual G4 and not the quad-four, G4 X 4 boxes, the
price-performance ratio will start rivaling a lot of boxes that cost
$40,000 or more. Especially given the extensibility of OS
X Server as well as the fact that it gets along with numerous Unix
versions. Toss in compatibility with Oracle's

applications, and a lot of eyebrows will go up.

Now, am I saying that Scooter is going to have serious problems in the near term? Of course not. But all things considered, would you rather spend $10,000 on a box whose performance is comparable to a $20,000 to $40,000 system, or would you insist on spending that extra money?

Next up is Avid. Remember my bearish comments and sentiments on Avid when it announced its forced migration to NT over the objections of its Mac customers? In my estimation, Avid basically slit its own throat with that decision. Well, Avid is now saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when it came to Mac offerings.

Neither Steve Jobs nor Apple wants to depend on only one vendor; when Avid balked, other solutions were developed as alternatives. (And I'm not only talking about Apple's homegrown Final Cut Pro.) Others will notice the opening and exploit it. Avid forgot that nature abhors a vacuum. And trying to say "Never mind," might be too little too late. Shorting Avid might have been prescient. We'll have to see.

On a related front, SGI is basically in the same boat. Some observers have characterized SGI's latest restructuring moves as a going-out-of-business strategy. I have a hard time arguing against that notion, even though the company is going to use MiPS in what you could call a "SGI Classic" and even if it uses Linux as the OS. About the only thing stopping a full-bore stampede away from SGI is that it was chosen as the development platform for Sony's PlayStation 2. My biggest problem with SGI: What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes.
Very possible. If not now, within the next year or so.)

What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions developed in-house and by its third-party vendors. When it first surfaced, this new direction prompted many members of the Greek chorus to start moaning, groaning and wringing their hands, until I informed them that just because Apple is focusing on digital video and audio publishing doesn't mean the company is washing its hands of traditional publishers. After all, there's

nothing stopping publishing pros from employing those solutions for traditional publishing. Most of the naysayers came in off the ledge when I pointed out that the G3 boxes they were currently using already had video capabilities, even if they didn't use it.

The key point here is that Apple's product offerings will soon surpass those of Avid and SGI when it comes to their price-performance ratio -- and possibly on performance alone. When Apple first launched Final Cut Pro back at April's National Association of Broadcasters gathering in Las Vegas, a lot of video pros said the software was good enough for about 80 percent of their work and that if future versions met the features of Avid's solutions and offerings, then that figure would rise to about 95 percent to 100 percent.

Why am I focusing on Avid and SGI while discussing the new G4 boxes? Because the majority of Mac users don't use them to design and test nuclear bombs. Most pro markets use them for "creative world"-type applications, including design and publishing, video, and audio.

But what really got me laughing is that critics of Apple and the Mac platform who had been insisting that the PowerPC chips weren't fast enough because they didn't go to 500 MHz are now downplaying the importance of speed. Is it because the G4 chips are not only in the 500-MHz range with the first boxes shipped and that those 500-MHz G4 chips are faster than a comparable Pentium III? Processor envy? Oh well. No matter. Price-performance is what will sway the target market for those G4 boxes, not whether they can sit there and tell others, "My processor is bigger and better than yours." It's not the car but the driver.

Stock rocket

I might as well end this column on a positive note. Apple has been hitting a lot of new 52-week highs of late, and it's perilously close to its all-time high. (Like within three points, give or take.) And even if others don't think the G4 boxes and the iBook pre-orders are a big deal, The Street seems to.

It's funny, but earlier this year when I opined that Apple's share price would head into uncharted territory, a lot of people thought I was crazy or had been out in the sun too long. Others listened to my reasoning and put their money on the table. Well, they haven't been disappointed to date, and there's still a heck of a lot of room to run for Apple. And given what I believe are Apple's future prospects, I wouldn't be concerned at all if its P/E ratio went up into the mid 30s. Why? For the same reasons I wasn't concerned about IBM's P/E ratios in '93 and '94. You're buying the future because of the turnaround, not the past. In

some of cases, I'm not concerned about P/E ratios in
determining whether a stock is overvalued or not. I wouldn't be
concerned
at all if Apple were sporting a P/E of 30-35 right now.
(And yes, I know full well where that would place Apple's share price.)

If I'm going to afford all those new toys -- I meant
tools! -- I guess I'd better get back to work making the money to buy
them.
Have a great week and weekend.

By the way, is it just me or are others getting a hoot
from Weird Al's "It's All About the Pentiums" song and video?

Only 1? :)

Seriously, it's not really worth talking to Netscape about the
'classic' rendering engine at all any more.

sinclap@my-deja.com wrote:

> I am sure these reviewers are video pro's or just tinkered with it for two hours?

As if it really matters. A professional wouldn't dare make the comparison, because it doesn't hold. A tinkerer wouldn't know enough to make the
comparison.

> You will get your wish of a G4 card. I would buy a g4 machine if you can justify and afford it. The top two new G4's have been optomized for it...

Fine.. but it's pathetic to take away the upgrade path for loyal Apple customers. There's no incentive to buy a new G4 if that won't be upgradeable..
who knows if Apple will pull this crap again? What about the ROM on the processor design that's being bandied about? Another Apple anti-upgrade move?
Stupid..

Plus, the first gen 400m G4's are 8100s in disguise.. stupid to rush them to market without the AGP slot, dual USB, etc (like holding on to Nubus for
the 8100s). Only a fool would buy one.

Avid often is not much smarter than Apple with some of their decisions.. but Avid is owned in part by Intel, what do you expect? Also, Avid NEEDS a
6-slot machine for best performance.. and, of course, that's a model currently lacking in their line, next year's rumors notwithstanding. The mistakes
were both Avid and Apple's.

> Here is Robert Morgan's take on Avid...

> saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over
> it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets
> handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when
> it came to Mac offerings.

RIDICULOUS. The pro world shoots in Beta SP mainly.. you NEED high quality m-jpg compression in order to digitize that format.. and that is a hardware
solution.

> My biggest problem with SGI:
> What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes.
> Very possible. If not now, within the next year or so.)

Sinclap, look at the above statement.. obviously, they are NOT shipping a comparable product. FCP is NOT comparable to SGI.. nor AVID.

> What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving
> very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions
> developed in-house and by its third-party vendors.

Now this guy seems to be an apple stooge. "Moving very quickly" toward dig video and audio? It's been there for five YEARS! This guy is as uninformed
as you are.

> The key point here is that Apple's product offerings will soon surpass those of Avid and SGI when it comes to their
> price-performance ratio -- and possibly on performance alone. When Apple first launched Final Cut Pro back at April's
> National Association of Broadcasters gathering in Las Vegas, a lot of video pros said the software was good enough for about
> 80 percent of their work and that if future versions met the features of Avid's solutions and offerings, then that figure would rise
> to about 95 percent to 100 percent.

Now, he says something that makes sense.. NOTE: NOWHERE ABOVE DOES HE SAY THAT AVID IS "SCARED" OR THAT FCP IS READY TO DETHRONE AVID NOW. He is
saying EXACTLY what I have said over and over.. maybe in a year or two.. and I have said FCP is a very good product for people who shoot a DV variant.

Of course, again, where the guy is missing the boat is that pros DON'T shoot on mini DV or a DV variant for the most part. Beta SP is still the media
of choice.. and FCP is not designed for the SP user the way the AVID is.

I can't be sure of that yet. Do you have tweakUI installed, or is
some other utility on your system giving the mouse the ability to
change window focus by simply passing over the window.

> > > Sure, Risc OS is not too hot under the bonnet, but ATM, the news/email

I still use Forte' Agent for news. My main problem with Forte'
Agent is the user interface where I am unable to use multiple
separate windows. It makes things awkward. The cascading and
tiling options aren't useful unless you have a 21" screen.

I understand. Is it that I have to agree with you before you feel that I understand? But the fact that when I type, the window in which I'm typing has to be in focus is no big deal for most INCLUDING myself. In fact some may prefer if the window is at the front. Far more often than not, I desire to see the entire window that I'm typing in, so yes, I may have use for your feature in a few situations. Am I an unadvanced user for feeling this way?

> (Unless you are using the broken GUI that comes with Windows.)

It's not a broken GUI. It simply does things differently from your Risc OS GUI. Stay over your corner. I do not wish to get into any 'big dick' arguments over who's GUI is broken from who's isn't.

If you wish to discuss how the GUI's differ and therefore how the Risc OS GUI may benefit some with special needs and tastes and therefore *arguably* benefit and please a wider audience then let's do it.

Yup, it's the stuff that causes certain NT PC systems [1] to lock solid,
until you unplug and replug the keyboard.

[1] Clash between the keyboard hardware and the intellipoint driver - both
keyboard and mouse manufacturer have done nothing, we've screwed
compatible replacement keyboards out of the PC manufacturer to sidestep the
problem

Try a DTP layout, fill the screen with the document, select a filer window to have as a small intrusion over part of that large window, drag and drop two different items into two different frames in the DTP.

The DTP window jumping to the front between each drag [1] is a pain in the nether regions, however in RISC OS...

Yes flicking through open windows with ALT-TAB is useful but then if a third party extension adds the feature why worry?

[1] Always assuming the Windows app and your release of Windows actually does do true drag and drop.

OK, but I still don't get the behaviour that you mention on my
NT4 GUI here.

> This is the kind of reason I don't like using Windows email/news clients.
> I've downloaded Bat, but I'm too busy playing Hunted to do anything with it

<smile>
Well, you are able to view messages in a preview pane or in it's
own window. You are also able to browse multiple e-mail folders
at the same time in separate windows. Mail composition is also
done in it's own window. It's quite a flexible app in this regard
and an excellent e-mail program overall. It does just what it
says, i.e., manage e-mail. It doesn't come bundled with html
support but instead provides the appropriate hooks for this with
it's approach to unrelated functionality being supported in a
similar fashion.

That's not a good idea - you can bow the fuse in the keyboard IC by
hotplugging the keyboard and/or PS/2 mouse.

the window underneath. This was the specific point to which I
was replying.

4190. New Milan II poised for success! TiFKAS Done Like Dinner!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-12 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-1209991655530001@ts7-59t-30.idirect.com>
Source record: 2853

well, after a couple of months, here's some more news on the upcoming Milan II '060 clone planned for release in early 2000 - which, by the way, confirms Motorola's involvement in the manufacture of the machine, as well as who will behind the distribution and promotion of the new Atari-compatible computer! Plus some new highlights:

- new distribution of Linux being developed for the Milan!
- a Macintosh emulator for when you HAVE to use a Mac program!
- three ISA ports!
- four PCI slots (for using industry-standard PC cards, kin you say FIREWIRE?)
- two USB ports for connecting those funky new devices!
- 8.4 gig Maxtor hard drive standard!
- Creative Labs video card!
- 32 mB RAM standard!
- MagiC Milan with Jinnee 2 desktop standard operating system/GUI!
- includes NVDI, PiXArt, fax software, Draconis Pro Internet suite, Omikron Basic +
GNU C++ programming suites
- new games being developed!
- plans for even faster Milans in the future (including iMac-toasting super machines)

PLUS! (for a certain trollish "kook" who maskerades as an "Apple Power Rep"), the reasons why the the overpriced, overhyped, underpowered iMac tanked in the German market place, and why the new Milan is better poised to be a success in Europe (of course, he'll claim that it's all a plot by the imaginary Atari "Jihads" who are "out to get him", when they're really hallucinations caused by methane, which has been building up in the Steve Jobs Reality-Distortion Field (tm) he's been trapped inside for the last few years). REAL computers don't come in fruit flavours!

Intrigued? check out this URL:

http://thor.prohosting.com/~bengy/m_milanii.htm

and afterwards, let's stick a fork in TiFKAS to see if he's done.
(An apple in his mouth would've been a nice if perverse touch, but that would be impossible to do seeing as he still has his head stuck in another orifice....)

4191. TAF Meeting September 15th - programming, IDE drives!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-12 00:00:00 UTC

Agenda for the Toronto Atari Federation Meeting, September 15th, 1999

We start the beginning of the TAF meeting season by taking a look at programming! Always wanted to design a program? Do you want to find a way to get your Atari to do something it previously couldn't. Not impressed with what TOS programmers have done and think you can do better? Tonight we'll give you an idea on how to go about it! We'll look at the different programs out there for designing and assembling your programs, including GFA Basic, STOS, and Sozobon. Be sure to ask lots of questions!

Also - Ken MacDonald, TAF's intrepid president and North American distributor of Mario Becroft's hardware solutions, will be demonstrating how to install the IDE board
inside your ST's case to allow for program storage without funny boxes outside the case,
plus news of new Becroft developments like the AT/serial mouse adaptor of attaching PC
keyboards and mice, and a new dongle that will provide both SCSI out and Ethernet for stock
STs (two words: CABLE MODEM).

It's going to be an informative and fun time at the next TAF meeting!
See you there!

UPCOMING TAF MEETINGS:

OCTOBER 20TH - Graphics and Graphic Design
NOVEMBER 17TH - The Famous and Amusing TAF FLEA MARKET!
DECEMBER 15TH - CHRISTMAS PARTY + MIDI Entertainment

TORONTO ATARI FEDERATION is dedicated to the preservation and continued use of
the Atari 8-bit/ST/TT/Falcon line of computers, users of the Hades and Milan clones, and users emulating these platforms on Macs and PCs. Meetings are held on the Third Wednsday of the month from September to June in the North York Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkholme Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina Line to North York Centre Station. Meetings start 7:00 PM, $2 to non-members. Membership is $25 a year, and includes a subscription to the PHOENIX newsletter. A membership in TAF IS Atari support!

I don't think there's any chance of that happening, seeing as Jack
basically drove Atari Corporation and JTS into the ground, and sold off
Atari's intellectual property to Hasbro for a pittance. Let's face it, the
Tramiels couldn't market immortality :)

and speaking of Atari, check this out:

It's a better idea than switching off the PC. (No, it won't reboot without
a three pin reset)

Only because Mac software, before PowerPC machines became common and faster, was more efficient and not just bloat. Now with G3's and soon G4's software houses can get away with bloated sloppy code that simply overwhelms lesser Macs. They've gotten lazy at writing compact efficient code for Macs...just like PC. These poor Macintosh owners upgraded because their old machines couldn't run any new software fast enough to be useful. I still haven't seen many software packages that make me go 'wow on a Mac yet.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>
> Please interpet...

This needs interpreting? Listen carefully and concentrate on your
comprehension OK? This means that if a retail appliance store had
10 sales people, you would tend to find that only 2 or 3 of those
sales people were able to sell appliances succesfully. The others
would sell enough to get by but not get ahead...got it?!

Here is some more comprehension for you. This could explain the
'limp appendage' issue for you (I dearly hope!). A man who is single
in New Zealand, when he goes to the toilet to pee, is said to be
'shaking hands with the unemployed'...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Whoa! Would Dell Dimension with Quietkey keyboard be one of these? My keyboard would lock about once a month for no apparent reason and I do have an Intellipoint mouse. The keyboard lockup required a power cycle to fix (never tried hot-plugging the keyboard). Problem went away when I replaced the Quietkey with a genuine IBM PS/2 keyboard because I liked the click (got the complete PS/2 Model 55 for $12 at a yard sale).

Ok, so maybe I won't need the other. I think I'll download a trial of
Perfect Screens.

> Suppose the mouse pointer accidentally falls on one of the background
> windows (this is very common for me because this doesn't normally
> concern me since it doesn't affect anything by default) it pops up
> uninvited.

My usual setting in X is "sloppy focus". Moving the pointer out of a
window doesn't change focus unless it hits another window rather than
the background. And "focus" doesn't mean "raise" in X, so nothing "pops
up uninvited" even if you touch another window, although you can find
yourself typing into the wrong window sometimes.

FeelX (Xfeel? I can never remember which it is) works this way too.

> Anyway, different strokes.

Yup. X is much more flexible than stock Windows in this respect.

>Enquiring minds want to know...

I imagine that at some point, a Nuon system will show up but, much like the Pippin, will quickly and quitely fade away. As I've last heard, Vmlabs is trying to get someone, anyone to put the Nuon in a high end DVD player or some super set-top-box game system. However there are problems with that.

Right now the trend is getting DVD players as cheap as possible. Last year the industry said that DVD players wouldn't sell below $250 till christmas 2000. That make was blown last Spring and now you can get a DVD for around $200 on sale. No one is interested in adding even $5 to the cost of a DVD system.

As for a game system, The Nuon chipset can hardly compete with the Dreamcast, let alone the Playstation 2 which is due out in months. Not even talking about the Xbox or Nintendo's Next Gen.

Dunno, depends on the internals of that keyboard I suppose. The ones we had
problems with were fitted with a collection of hotkey buttons for
multimedia use. CD start/stop/pause etc.

> My
> keyboard would lock about once a month for no apparent reason and I do

The lock up problem is documented apparently, Personal Computer World
made mention of the issue shortly after the mouse was released.

> The keyboard lockup required a power cycle to fix (never tried
> hot-plugging the keyboard).

Suggested test for the problem when we phoned the PC manufacturer - who
would have replaced the whole PC if things got totally wazzed.

> Problem went away when I replaced the Quietkey with a genuine IBM PS/2

So all major computer firms should be like the defunct Atari and
stagnate technology like? Should Sega had not released DreamCast due to
the fact that games are larger and need a CD/DVD format instead of
cartridge format?

We Mac users like update and cheap hardware like the iMac and the new
G4/400. I suspect most of the ST buckets are collecting dust in the
attic while much of the owners have moved on to greater things on the
mac/pc platform...

Sounds like sour grapes here...

You're right, in 10 years the Mac OS *might* catch up th the ease of use,
and functionality of modern Atari system software. I played with the iMacs
and G3's at CompUSA for quite a while the other day. None of them had any
thing that I found wanting in my MiNT/N.aes/Thing setup. In fact, I could
not find anything as slick as Freedom, the penultimate file selector!

I just want to run a casual, informal online survey here. Would all former
Atari users who have switched platforms, to the Mac, directly because of
Sinclaps posts/arguments, please post here.

Also, to be fair, would all those users who have decided to never own a
Mac because of Sinclap, please indicate this in a follow-up as well...

PS Let me start the ball rolling by saying I'll never own a Mac, and
it is directly because of Sinclap...

nope, uses OS 7.5.5, which you can get FREE. Not as bloated as current
vapourware.
>

>
> Playing catch up..

nope, again, cutting edge. I believe the iMac only has a 6 meg hard drive?
>
> > - Creative Labs video card!
>
> Lets hope the drivers are written..

yep, there will be drivers. fVDI (already used with the CORE Eclipse
card for the Falcon, which uses a Rage card, same one as the iMac) is
designed for use with several industry standard graphics cards.

>
> > - 32 mB RAM standard!
>
> Not 64?

nope, since TOS and MagiC were designed for efficiency, unlike the
bloated Mac OS that needs a fast chip, buckets of RAM, and large hard
drive just to install the minimum requirements. On my Falcon it just
required 4 megs of memory and about three megs of hard drive space...

>
> > - MagiC Milan with Jinnee 2 desktop standard operating system/GUI!
>
>
> Still not OS 9 caliber...Maybe in 10 years..

yep, the MacOS needs to catch up with the elegance of MagiC/Jinnee....

Clarisworks is dead (probably by decree of Bill Gates, who threatened
to cut off Apple's oxygen supply again?). I believe Texel will be bundled
with the Milan as it was with the original.

>
> Is this a hacker or consumer machine?

both. TiFKAS is just a hack writer...
>
> > - new games being developed!
>
> By jagflop developers with those unfinished titles... Does

> > don't come in fruit flavours!
>
> Did not Apple post double digit gains in Germany thanks to the iMac and
> G3's?

no it didn't. Indeed, the article goes on to say WHY the iMac tanked in the German market, and that the Mac has a very small user base due to the fact they're overpriced.

>
> Germany is one of the 140+ countries on this planet.

no s**t, Sherlock. And it's one of the countries where the iMac is seriously tanking.

>
>
> Just sinclap..

yep, just the same mealy-mouthed moron who pretends to be an Apple Power Rep, and has proven that he doesn't know beans about the video market, no less computers....

> Sent via Deja.com http://www.deja.com/
> Share what you know. Learn what you don't.

what TiFKAS knows - NOTHING. What he is capable of learning - NOTHING.

I use mine as a doorstop. If I had a Microchannel ethernet card I could
use it like you are.

Undoubtedly some have moved across to Mac/PC, while some still span the gap between Atari -> Mac/PC, but there still seem to be a large number of us using these comp.sys.atari.* newsgroups...maybe that means we have good reasons to stay with our Atari machines...

> Sounds like sour grapes here...

Not at all. I can and do use Atari, Mac, and PC, yet I prefer my Falcon because software on that is faster than ever with each new release. On the Mac (new only 2 years ago) every new software upgrade has left me wondering if the CPU clock is progressively being slowed down! Software bloat is the reason. As an example I grabbed a demo of Star Wars - The Gungan Frontier a few days ago...it swallowed 50 Megs of the Mac disk yet was a basic 'walk-through' with only a handful of the full features included. It looked like a pretty cool game but I'm sure any decent Falcon coder could do the same in 5 megs...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Is that the best you can come up with? Such desparation....

Not desperation. Fact. A 1992 Falcon running MagiC will multitask
Mountain and Photoline together better than a 1992 Mac (even one
using Mac OS 8.x) trying to run Photoslop and FCP together...

In fact when Apple sort out what multitasking is get back to me
and we'll do a fair comparison, because I guess MagiC leaves
MacOS dead in the water when it comes to multitasking...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>Falcon coder could do the same in 5 megs...

Nonsense. It's not code that makes modern games large, it's content. Few games have more than a megabyte or two of executable code. High resolution 16- and 24-bit images, high quality sounds, and high polygon count models in 3D games suck up a huge amount of space. If there's anything to blame for this, it's the CD-ROM, which let game companies vastly increase the amount of content they could deliver with a game.

Just for example, the Quake 3 Test (Mac version) application is 992 KB. The PAK0.PK3 data file for q3test is 63.5 MB.

Demos are also often larger than they need to be since they're pushed out the door either during crunch time or after the game has shipped. In the first case nobody has the time to really strip down the demo version as much as it should be, because they're too busy getting the real game finished. In the second case nobody cares any more, and the schedule is tight anyways since they want to get the demo out as soon as possible to help market the game.

Now, you want to complain about bloat in word processors and the like, there you might have a case.

However, I'd bet good money that the Atari platform would suffer the exact same problem if it weren't for the fact that the last time Atari itself released a new computer was what, 1993? (Or was it '94? Can't remember.) It's very simple; the lack of hardware advances means that software authors target only what's out there. Yes, there are now faster Ataris, but I doubt they are anything more than a drop in the bucket compared to even the Falcon. You can't even think about something like Quake 3 for the Atari platform; the hardware just isn't there. You can on the PC and Mac, so it happened.

uh, I don't know how to tell you this, but there IS a new TOS-based
machine coming out early in the new year - and ironically enough, Milan
GmBH IS in negotiations with Hasbro's US operations to license the Atari
name and Fuji logo. The machine has a number of new features:

- new distribution of Linux being developed for the Milan!
- a Macintosh emulator for when you HAVE to use a Mac program!
- three ISA ports!
- four PCI slots (for using industry-standard PC cards, kin you say
FIREWIRE?)
- two USB ports for connecting those funky new devices!
- 8.4 gig Maxtor hard drive standard!
- Creative Labs video card!
- 32 mB RAM standard!
- MagiC Milan with Jinnee 2 desktop standard operating system/GUI!
(note - pre-emptive multitasking)
- includes NVDI, PiXArt, fax software, Draconis Pro Internet suite,
Omikron Basic + GNU C++ programming suites
- new games being developed (including what sounds like ports of some
more famous games)!
- plans for even faster Milans in the future (including iMac-toasting
super machines)

oh, and did I say that Motorola themselves are taking part in the development and manufacture of the machine? Plus the fact that Milan GmBH's previous clone, the Milan 040 model, has been selling 50 machines a month since its release a year ago, and are still back ordered - not bad for a small just starting out operation from Germany, and what obviously got Motorola's attention.

the full story is at http://thor.prohosting.com/~bengy/m_milanii.htm

Never thought I'd have to defend this particular platform in THIS forum :)

Looks like Bill Gates will be up at night dreaming up ways to cut off this company's oxygen supply :)

4216. Re: VM Labs...Were are they?

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-15 00:00:00 UTC
From: lucas <lucas@aa.net>
Message-ID: <37DFC506.C273284@aa.net>
Source record: 2879
Cross-posted to: rec.games.video.atari,comp.sys.atari.advocacy

This is not correct. VM Labs does not intend "NUON enhanced" DVD players to be more expensive than the old DVD players. The intention is for them to be the same price - to be competetive, and to eventually be considered to be standard for DVD players. They hope that in the future all DVD players will have the NUON chip in them. The reason the "NUON enhanced" DVD players are not supposed to be more expensive than current models is because the NUON chip is a substitute for the chipset that all current DVD players have anyway (current DVD players need processing power to decode the compressed video data on DVDs).

Also, the NUON is much more powerful than the Dreamcast or any other game system. I don't know the technical details of how the NUON works (I don't think the info is available - it's confidential), but based on what has been said about it, it sounds like it uses technology similar to "reconfigurable computing". Do an internet search for "reconfigurable computing" to understand what this means - I don't want to write a long explanation here. The reconfigurable computing concept is clearly the wave of the future. It replaces the standard processor paradigm, where all computation is done with a single group of hard-wired machine instructions (you know, the instructions processors like the x86 have that you use when writing an assembly language program - stuff like "mov", "sub", "div", etc.).

Check out the following link. All standard processors are obsolete (Pentium, G4, etc.).
http://www.starbridgesystems.com/home/index.htm

Their computer is 60,000 times faster than a Pentium. It's available now, but it's expensive. They say they will sell them for about $1000 though in about a year from now. It can be expanded in power by adding chips (not multiple processors) that all act like a single re-configurable processor. Systems that use multiple standard processors (Power PC, Pentium, etc.) are obsolete. Adding more processors is just a hack anyway, not elegant or intelligent at all. Read the stuff by Star Bridge systems.

We have a box of old ones with no conceivable use. Don't know how many in
there because we can't be bothered counting.
When the kit finally goes (soon) the whole lot is skip filler.

Granted, but in many cases I cannot see how so much data translates into
so little graphics or sound...have the programmers used incompressed TGA
to present graphics or something silly like that?

Games are one case, but applications such as DTP and graphics are another
where I see huge bloat occuring over the last few years, moreso on PC but
now also on Mac. I believe it all comes back to the 'grow the software big,
and invest in hardware stock, because hardware sales will go through the
ceiling just so people can run this large new software' philosophy that
Microsloth started with the release on Windows95...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I wonder how much the shipping to the US would be? Probably more than
the cards would cost at a flea market I suspect...

found this at comp.sys.mac.advocacy. Apparantly it's not just TiFKAS'
posts that smell funny....

LOL!

http://www.salon.com/tech/log/1999/09/15/mac_smell/index.html

Eau de Mac

Apple's new G4 has a sleek look -- and a strange scent.
- - - - - - - - - - - -
By Janelle Brown

Sept. 15, 1999 | If the prestige scent of the past was the rich, leathery
perfume of a brand-new sports car, perhaps today's olfactory status symbol is
the smell of scorching plastic.

The Mac G4 is the most recent computer to come off the Apple assembly line, a
zippy silver-and-gray workstation that runs on a new Motorola processor, and
the latest must-have machine for Mac fanatics. But the stylish computer comes
with an unexpected feature: It apparently smells terrible.

A recent review of the G4 on the MacInTouch site for Apple news commended the
new machine for being "pleasantly quiet," but also noticed that the computers
had an unpleasant odor when turned on. The reviewer wasn't the only person to
notice the G4 stink: This little bug has also been documented by the Apple
Tech-info library, and filed under "Odors May Be Present Short-Term."

According to Apple, a plasticky smell will occasionally waft up when the
computer is turned on and allowed to warm up to its "operating temperature." As
Apple placates concerned owners, "the odor is detected when the product is new,
similar to odors generated from new carpeting or a new car. In most cases the
odor will dissipate over a short period of time." But the only quick solution,
the site says, is to turn your computer on and leave it running for 24 hours or
more, effectively burning off the smell -- and filling your room with a wallop
of a stench that could last several days.

Ah, the smell of hot plastic in the morning ...

that's spelled "a dime a dozen". Which is a legitimate criticism.

of course, TiFKAS' "opinions" aren't even worth two cents...

> > Which planet did this guy get off from?
> >
> > I think he should see a shrink...and mend his ruptured mind...poor deluded
> > soul...
>
> Or he could be yanking your penis for all we know..

something TiFKAS knows so well from personal experience. Especially in
front of Macintoshes. Sometimes when they're even turned on! :)

The real truth is that
> he was taking the demise of future Amiga models by GateWay hard..

Bill has also since posted in mac.advocacy that he likes the specs of
the new Milan II and he wants to see this new machine, as he feels it has
potential, especially with Motorola's backing.

speaking of which, TiFKAS, weren't you a month or so ago braying that
the new Gateway Amiga would ultimately crush the new Milan II?
HAHAHAHAHAHAHA!

well, well well. Number of Milans produced since August 1998 - over 50
per month (and still back-ordered). Number of past and future Gateway
Amigas - ZERO.

Add that to the number of TiFKAS predictions that never came true.
Still pucking blood over your gaff with Virtual Game Machine, "Sony will
do a licensing deal", then when that didn't happen, "Connectix will
prevail in court", ignoring of course the fact that Sony is a 500lb
gorilla with lawyers with no sense of humour. Even MacAddict have
pronounced VGS dead! More strained spinach, Cartman?

BTW, read the statement from the new head of Amiga Inc. yet? Probably the most blatant example of weasel words and TiFKAS-speak I've ever read in my life.

August 1998, Milan GmBH. Over 50 per month and still back ordered.

And as I have said before, TiFKAS not only can't tell his ass from a
hole in the ground, he also thinks he's an ostrich...
>
> Nobody cares about 1992 machines..

Centek and CORE do. Their new boards for video RAM and acceleration
turn Falcons into lean mean fighting machines. Kin you say PowerPC?

And you should see what's coming even for the 1985 machines - there's a
new SCSI/ethernet adaptor coming for STs that's just plug and play. I've
seen the beta for the new PC keyboard/mouse adaptor on Wednsday as well,
which includes some interesting driver software as well, and is designed
also to be plug-in friendly - this is going to be one hot seller, as well
as the new graphics board coming for the ST. Tell me, when was the last
time anyone came up with such neat stuff for the same vintage Macs? Other
than the fact they make nice fishtanks...

>1999 machines are half price...

tell me where to find these half-priced iMacs, which are just as
imaginary as your claims that you're an "Apple Power Rep"....

the MagiC/Jinnee combination is better than good enough, but for those who want to use Linux it'll be a great option for those who want it. And of course, with Ataris, you'll be able to choose different operating systems as well for when you need them.

OS9 is still vapourware, according to your yardsticks. 7.5.5 may have had its problems, but it's still pretty good, and it's pretty stable on this Quadra 950 I've got sitting here in my computer room.

BTW, note that TiFKAS has called a Mac OS junk......

>

but an option that can be utilized and added if needed. Not like how Apple deliberately tricked B&W users to cripple their machines via an update patch that prevents them from adding G4s (and which Apple is currently trying to dodge the issue on)....

>

> > required 4 megs of memory and about three megs of hard drive space...
>
> But TOS will not be able todo what OS9 will do...Yesteryear's OS at
> today's packaging...

since by your own admission the only ST you've used ONCE was one of the first ones with TOS 1, your opinion on what is modern in TOS is worthless. Having been a MagiC user AND a Mac user in the last year, I'd say that MagiC not only goes toe-to-toe with Mac OS, but in many ways leaves it in the dust - and at much lower RAM and hard drive requirements.
>
> > > Still not OS 9 caliber...Maybe in 10 years..

Not on shelves in this part of the world, TiFKAS. Even the Mac dealers
here don't have it on their shelves, and I certainly can't find them at
well-respected business-related stores like Business Depot, Office Place,
Grand & Toy, etc. Plus didn't I hear that Appleworks is being
discontinued, since Bill Gates doesn't like to see one eensy-weensey bit
of independant marketing from his lapdog Steve Jobs?

>

cretins who can't even SPELL the term "a dime a dozen" aren't exactly
pure gold either....

> > It's obvious you didn't read the article, pinhead. Why weren't you
> > laughing when Jobs claimed that the G4 is a "supercomputer"?
>
> I did not see the details on these iMac toasting supermachines..

they're there. At the time of the writing they speculated that new
machines would be based around the Coldfire chips Motorola developed which
go up into the hundreds of megahertz. Of course, since that article was

written IBM has opened the way for PowerPC to be used by manufacturers other than Apple. Imagine if Milan and ASH comes out with a TOS/MagiCMilan/Jinnee combination that utilizes the PowerPC, you'll really see TiFKAS sweat.
>
> The G4 is a supercomputer...What do you not understand?

I understand that Apple is basing their laughable claim on specs by the US government that are WAY out of date - the same specs actually made a Pentium II PC a "supercomputer" TWO YEARS AGO! But Intel had the sense to keep their mouth shut on that regarding reporting that to consumers, unlike Steve "arrogant bonehead (TiFKAS' own words, folks!)" Jobs, who has to coat every new product out there with his Reality-Distortion Field (tm), and has a history of using outdated specs to try to make his computers look good. Have we already forgotten his "iMacs can toast 450mHZ Intels" fiasco, in which they fudged their data using Bytemarks optimized for 486 PCs, and when PC magazines did their own tests using PROPER benchmarks, the iMac got its little plastic butt kicked by first-generation Celerons?

If Jobs wants to call his G4 a "supercomputer", then let him run it in real-time tests with a universally-recognized supercomputer - a CRAY - and then see what happens. Most likely the G4 would wind up looking like a real lump of charcoal....

>
> > >

> > fact they're overpriced.
>
> According to the latest 10k, that continent up by 40%....

which is still not good enough, unfortunately - apparently Apple's installed base of machines in Germany to date since the Mac was introduced is still far from one million. Atari achieved a one-million user base YEARS ago, and Amiga did even better. I think the factor here is that Apples still cost too much for the average German - money better spent on a Volkswagen or Opel.

>
> > >
> > > Germany is one of the 140+ countries on this planet.

>
> You sure...?

sure I'm sure. Indeed, I did figures on you "140 countries" claim, and
according to that Apple averaged a sale of 14,000 per country over a
year's period. Which means that somewhere on this planet, the iMac is
tanking. Like in Germany.

MacOS 9 has been available for ordering from the Apple Store since 9-9-99.

Let me be clear on this: I loathe and despise what they did there.

However, Apple never claimed the machine was upgradable. The people most likely to buy a CPU upgrade for a machine that is under a year old are exactly the ones that Apple will sell the first G4's to. Apple needs enormous numbers of CPU's to get its product out the door. The upgrade vendors don't. There was a good chance that upgrade vendors might have G4 upgrades weeks or months before Apple could deliver G4 computers. That would have hurt Apple very bad indeed.

>of the now-non-cutting edge B&W G3s.....

Exactly, now-non-cutting-edge. The G4/400 (the bottom-of-line configuration) comes with a 10GB harddrive. And by the time this new Milan comes out, the next generation iMac should be out too. With a larger harddrive than the present ones, I dare predict. Besides, this is a consumer machine. Average consumers

will have a hard time filling a 6 gig drive.

>> Have you seen OS9?
>
> ah yes, a kludge for Apple to buy time because they can't get OSX
>Consumer out on time, I guess it's been over a YEAR now? Kin you say
>COPLAND, boys and girls? Kin you say RHAPSODY?

Not to buy time for OS X, OS X has been scheduled for early 2000 all the time. And OS 9 is important as the last OS that be supported on pre-G3 PowerMacs. It should provide good integrations with machines running OS X, kind of like System 6.0.8 did when System & came out.

> BTW, it might not be a good idea to keep using the term OS9, as Apple's
>getting sued by the owners of that copyrighted brand name OS...

Yep, they're being sued by Microware. But the question will be wether they can stop them from using the version number for their software. Remember why Intel changed the name of the x86 range because they couldn't copyright the 486/586 number?

>Pentium II PC a "supercomputer" TWO YEARS AGO! But Intel had the sense to
>keep their mouth shut on that regarding reporting that to consumers,

No, it didn't. I doubt Intel would have left such a hige marketing-opportunity unused. By the US governments standards, the PowerMac G4 is a supercomputer. Period. Yes, the standard is outdated, and Apple are negotiating with the government to have the specs raised so they can sell their G4 to "sensitive" countries too. But they're not lying when they say it's classified a supercomputer. That's advertising for ya.

Market-share and installed base are not directly linked. Apple's computers have a far greater useful life-span than Wintel computers. You stated yourself you have a Quadra 700 running MacOS 7.5.5. Usually installed base is measured by tallying sales and "correcting" that figure by assuming that computers over a certain age are no longer in use. That way, figures become (somewhat to very) dodgy and biased.

Computers are not usually bought off of the same budget as automobiles.

Gtx,
Joost.

Tos light? What is that? I've been an Atari user since 1983, and I've
never heard of Tos light...

TO answer your question though, I'm not kidding and I'm not in denial.
I used the iMac and G3 at CompUSA for about 2 hours a few weeks ago. I
came away unimpressed.

BTW, where can you buy OS 9 right now, and for how much?

Hmm, wait a minute. I think I have OS9 for my ST from years
ago... ;-)

Hi all

I'm a Milan user and i've been a Atari user since -86. I'm using W98 at work and i have two brothers that uses a Mac and both the big systems have some catching up to do in my opinion. Especially multitasking works much better (maybee that should works period) both on Atari systems and Amigas. And fileselectors, nuff said.

The demo of Star Wars - The Gungan Frontier was limited in what
was able to be done, and only 2000 Gungans were allowed to be created
before the demo quit...

I also shall have you know that I am a highly skilled completor
of games!! :)

Do you know anyone who has completed Abes Exoddus on Playstation
WITHOUT taking a break? I do!! ME!! Mind you I thought I was nuts as
it took a couple of days with nothing but potato chips and fizzy
drink to keep me awake that whole time!!

>to present graphics or something silly like that?

Consider that a 640x480 24-bit image takes 921,600 bytes, or just about a megabyte, uncompressed. Few games are going to use a lossy high compression ratio scheme like JPEG; at best they're going to use PNG (which, by the way, is actually what the game I'm working on with some friends does). And compression only helps on the disk side of things; usually images are stored completely uncompressed in memory because it might cost too much CPU time to uncompress on the fly, particularly in action games where the action should not stop or stutter.

16-bit stereo sound at 22.050 KHz (pretty much the minimum standard today, although I bet a lot of games even go for 44.1 KHz) eats about 86 KB per second of audio. It doesn't take much music or sampled speech to start racking up a large quantity of data that way.

Games frequently also have opening and closing cinematics. That can easily chew up 100-200 megabytes all by itself.

Really it dont matter.

What I would like to do is use the Falcon to run Linux and Linux apps
(ie ftp services, mail, www, net scape, etc)

And maybe Wine (Windows emulation under Linux, said to be faster then
Windows itself)

I use AIX 3.2 on an IBM Risc machine at work, so I am fairly familure
with Unix, and to keep my Falcon Alive I just thing that Linux would be
cool to have on there.

Thanks

problem is, ONLY from the Apple Store, then. Apple won't ship anything
from the Apple Store to Canada. They've been dragging their feet regarding
opening a Canadian Apple Store online for two years (last deadline was "by
May for sure!", but they forgot to say what year :))

I'm glad you can admit that - TiFKAS, of course, would just lie,
wheedle and spin everything around....

uh, one problem there - apparently the "Yikes" machine (the 400 mHZ
model Apple released as a stop-gap before the Sawtooths come out) utilizes
the same motherboard the B&W G3 does. Would that not signify that Apple
intended that the G3 was designed to be upgradable to a G4 in the first
place?

Of course, Apple never said "no, you can't upgrade this to a G4" either
when they sold the machine to the consumers. That would've been more
honest.

> ones, I dare predict. Besides, this is a consumer machine. Average consumers
> will have a hard time filling a 6 gig drive.

that's the whole point - TiFKAS was basically playing "mine is bigger
than yours" with me, and I called his bluff on what was available right
now. Seeing as the target date for the new Milan is January, and seeing
that it is supposed to be priced below an iMac, the iMac will still be
non-cutting edge regarding hard-drive capacity. Besides, isn't it a little
late now to be predicting a new iMac? Christmas sales are coming up, and
they'd have to have it out way before Christmas to have an impact - the
pundits were predicting an announcement on a new imac at the show in
France, and they were disappointed.

You're probably right on consumers not filling the hard drive - but in
an Atari's case, you don't need that much hard drive space anyway unless
of course you're doing major DTP or graphics or video work. Since the
specs of the new Milan II indicate that Milan GmBH is designing this
machine for graphics and video, it's justified to have such a large hard
drive to begin with (I worked with my Falcon with as much as 500 megs of
available hard drive space and never even got to fill it, compared to the
Quadra which is already requiring lots and lots of drive real estate - the
500 meg drive inside it is just not enough!)

> 6.0.8 did when System & came out.

uh, a problem - according to Macintouch yesterday, a vendor mentioned
in announcing upgrades to a new product let slip the fact that as of now
Apple has not shipped any betas of MacOSX Consumer out to developers. And
it's also well known that the latest version of the OS was supposed to be
known as OS 8.7 - the name change indicates that Apple wants people to
think this is a revolutionary new OS. Hence, buying time.....

well, looks like I'll soon be able to buy a Mac 7200 for $79 :)

dealer
> can sell it to you.

since they can't seem to sell it to me NOW, I'm not impressed. TiFKAS
stated that Appleworks "is sold on shelves". What shelves when even the
Apple dealers don't have it? I haven't seen it at Computer City, CPUsed,
Carbon Computing, etc. They may have the hardware, but the software
selection at these stores is somewhat pathetic. They have DOOM in stock,
oh how 1994 of them....

that's all I needed to know - "The standard is outdated". Hence it's
silly for Apple to call the G4 a "supercomputer". Period. Like I said, if
Jobs wants to keep spreading his FUD about "supercomputers", then let him
run public tests on what the public recognizes as a supercomputer - a Cray
- against a G4 and let him honestly post the results of the tests up....

> Computers are not usually bought off of the same budget as automobiles.

but households have to decide what are more important, computers or
cars. And if the price of a computer is about the price of a hefty
down-payment for a VW, what are they going to decide? That's why the Atari
was popular in Germany over Apple for years - truly "Power without the
price", the same processor as a Mac for a lot less money. And that's why
the Milan, despite TiFKAS' FUD, has been doing so well for such a small
company with relatively small outlay at the start - they've come a long
way in the last year, and they're truly going forward.
>
> Gtx,
> Joost.

at least you are more honest about the situation as you see it - face
it, the Mac community is often tarred with the brush of being mindless
drones who hear and obey without question and shun any bad news. You're
certainly one of the ones breaking that stereotype, unlike TiFKAS, who

merely reinforces it....

> Amiga models. Can someone trustworthy authenticate this? (Clock-
> Meister? U out there?)

sure, DarkChyld - straight from the horse's mouth at http://www.amiga.com .
Their new president has posted another letter to the Amiga community
clarifying the nebulously doublespoken September 14th letter, in which it
confirms that they've dropped any thoughts of producing a new computer,
and will now be using the Amiga technology with some business partners in
producing Internet set-top boxes for TVs!

What was most ridiculous was in the September 14th letter was the statement:

"I hope you'd agree that Amiga was never about a box. It was never about
an operating system either. Sure those things were part of what made the
original Amiga great, but at its heart, Amiga was simply about a better way.
Amiga was ahead of its time. Amiga promised to change the world. It ran against
conventional wisdom and was better than anything out there at the time. In fact,
we could all argue that it's still better than anything out there.

"The ideals and spirit of that original Amiga are alive and well today. But to
limit Amiga to just one box, one product, one OS, is to keep Amiga from ever
seeing its full potential. Think about it.... The original Amiga never did
really reach its full potential despite its technical advantages and its cost
and ease of use advantages. Why? Because it never became ubiquitous. The
company's early vision was probably too limited for the vast potential that
Amiga offered."

now isn't that the most ridiculous thing you ever read? And I thought
only TiFKAS would try something that boneheaded to bamboozle their loyal
users....

Can you guess as to WHY CompUSA is flushing itself down the toilet?

Ever check out that ^*#^& return policy that nobody else would dare offer to consumers?

Ever wait in line 40 minutes just to exchange a defective product?

Even when they had better return policies, you had to bicker forever to get them to give you cash back (which was more difficult than store kredit.)

Oh yeah, employees are stupid too. No the techniacl ones, I run rings around them but the clerks and counter clerks. The counter clerk told me I had a 10 day time period to return the video card for a FULL refund. (this incident happened 2 months ago). I returned it 2 days later but ran into a problem - they, after fighting, reluctantly gave me credit. What the F^ happened to this 10 day full refund sham? Who's lying?

Their cable prices are shit, too. Sorry but I will not pay $50 for an external SCSI cable (screw USB which is equally low-power and no-class and blew up in Gates' face so it'll become a standard) when Best Buy has the same frigging cable for $30!!!!!

KompUSA can rot. And I'll happily tell everyone my nightmare stories...

But at least Apple, who like KompUSA deals with crap, might go under if KompUSA does so I'm now doubly-happy.

No Apple store in canada?? Sheesh... seems Apple Canada (is there such a thing?)
is even wordse than Apple Netherlands/Benelux (at least we have an Apple Store).

And yes, AFAIK, only from the Apple Store, since this is not shipping, but
taking orders.

But I wouldn't call it vapourware if they're taking those orders now.

>place?

Yes. It was built in such a way that it could (can) be upgraded. The move to
introduce the "G4-block" was highly controversial, even within Apple (according
to AppleInsider, whom I regard highly as one of the more trustworthy

AppleWatcher sites). I have little doubt that a next issue of the Yosemite ROM will be released soon to resolve the issue. Apple did this, as I said, to ensure that they would not be beaten to the G4 market by too large a margin.

There have even been rumours that the block was imposed by the US government, to ensure that the same sensitive countries that can't import the PowerMac G4 can't build their own either. This is cotswallop, IMO. As I said in my previous post, Apple are negotiating with the government to get the export-ban lifted.

Even though the low-end G4 model is based on the "Yikes!" architecture, basically a modified Yosemite (B&W G3) motherboard with a G4 processor, and is regarded by the Mac community to be a "non-buy" because the *real* G4 (Sawtooth) will be out in weeks, this is the one to go for if you need immediate G4 power. Thsi is exactly the market that would have bought G4 upgrades for Yosemite machines. By buying a Yikes! machine (an Apple-upgraded Yosemite, if you will), they ensure that they also have Apple's support if anything doesn't turn out the way they expected. That is worth a lot to some people.

> Of course, Apple never said "no, you can't upgrade this to a G4" either
>when they sold the machine to the consumers. That would've been more
>honest.

I agree. But Apple is not responsible for doing that. Apple is a business, not your neighbour doing you a favor by selling you his computer. You can't bash Apple for blocking an upgrade for its machines. You can bash them for doing so in a sneaky way.

I was one of those predicting the launch of the new iMac for the Paris keynote. (although the keynote not being webcast by Apple was somewhat of a clue it might not be very spectacular.) I was very disappointed. I don't know of any major events in the near future that would provide a good opportunity for the launch. I'm sure they will find one, though.

It would have been nice also to give the European Mac-market something, too. They've been saying there are 4 major Mac-events now (SF, NY, Paris, Tokyo), but only the american events get the big splashes. Apple need to address that to build more confidence among their non-US customers. The CEO actually doing a keynote overhere was a step in the right direction, but not a big enough one.

Ehm... Developer preview was seeded in may, at the WWDC. The vendor in question was probably peeved off that they didn't give a preview to vendors as well. I know I would have liked to have one... The second preview is to be released any second now. That might be the final one, as even the first one had pretty much all the features of the final release implemented.

Then there's the little issue of OS X server... This is widely regarded as a "very public" (and very expensive) beta for OS X. Apple might have released this "bare-bones" OS X also to build confidence, especially needed after the debacles of Copland and Rhapsody.

Mac software is notoriously scarce on shelves. Apple really oughta push vendors
more. However, that still doesn't make AppleWorks "dead".

Honesty and marketing don't go together very well. Advertising isn't about
telling the truth, it's about not lying so you can't be sued.

There is a spec (even if it is hopelessly outdated) that classifies the G4 as a
supercomputer. So market it as being a supercomputer. Simple as that.

Germany is one of the largest economies in the world. (And used to be one of the strongest :) It is also one of the more automobile-centric countries. I very much doubt that any German household is gonna decide on wether to go for a downpayment on a Volkswagen (or a BMW or Mercedes) or a computer. Most will buy a car anyway, and if there's money left over they'll buy a computer too. Now a couple of years ago the price difference might have attracted many people to Atari over Apple, but these days... Most if not all of Milan's computer are probably sold to Atari die-hards. There are a lot (I mean a *LOT*) of those in Germany (and in Europe in general, Holland, England and Poland are strongholds too). So sales-figures of 50+ a month don't strike me as odd at all. But I think they don't come out of Apple's marketshare.

Gtx,
Joost.

Wine Is Not an Emulator. (hence WINE) Unless something has changed very recently it will only work on x86 machines, which rules out the Falcon.

One thing of interest I read in the local paper was that none of the Apple
Trained CompUSA people were going to be included within the 1800 head
count. Seems only the PC side of the store was getting hit.

well, you know that when they announced the plans for the Linux-based
Amiga, someone likened the effect to dropping an atomic bomb on
amiga.advocacy. This latest bit of bad news I liken to being like Nagasaki
after Hiroshima.

Even more interesting - two-three weeks ago, Jim Collas, the architect
of the new Amiga and president, abruptly resigned from Amiga Inc. and at
the same time dumped all his Gateway stock. This was followed by the
sudden disappearance of the planned new Amiga details from amiga.com and a
letter from management stating that an announcment would be forthcoming...

stranger things have happened. I'm personally looking at sending his
original letter off to the National Council of Teachers Of English as a
nomination for the year 2000 DoubleSpeak Awards. Amiga's new president
probably is the worst official mangler of language for them since General
Alexander Haig sat on Amiga's board of governors (Gen. Haig won his own
DoubleSpeak Award in 1981 when, in testifying to a House Investigations
committee how three nuns and a lay worker were killed by soldiers in El
Salvador, Haig claimed that the nuns "were probably trying to run a
roadblock" - and even hinted that the nuns were involved in a blazing gun
battle! - which he then denied he ever said to the Senate Investigating

meeting next day!).
>
> You sure TiFKAS didn't help pen that message? <grin>

I'm sure he could've, and then the secretaries at Amiga Inc. translated
it from the original crayon :)

like his inability to spell - or his boneheaded predictions that go wrong - or his utter cowardice in dealing with Particle Salad's unmasking of the fact that he doesn't know beans about how the video industry works - or being caught with his pants down with his bogus "facts" about Ataris - or his outright refusal to post any evidence that he's employed by anyone associated with Apple, using the lamest of excuses - or, when he is obviously losing the debate, starts hallucinating about his imaginary friend "Chunks", or claiming he's a "macho stud"....

actually to be fair to Bill, he's admitted that his post was meant as parody, and he has apologized to any and all Atari users he may have offended - he also said he really wants Milan II to succeed, as he's impressed with the specs of the new machine. Apology accepted, Bill!

Now compare that to TiFKAS, who has of yet not apologized to anyone regarding his steaming piles of drivel and his abusive behaviour towards anyone who uses any form of Atari despite being confirmed as a total uninformed schmuck over and over and over.....and funny that he seems to be obsessed with "little Peter".

THAT'S for sure, but considering the upgrade from the origional specs of
my machine to ones that could actually run the game were half paid for by
MacZone in a promotion, It only took a 3Dfx card to complete the puzzle.

I just hope when I upgrade to run Halo I can be as lucky.

It's not how much you must upgrade, it's how much you can get for free!

TOS is ROM loaded, and most Atari users will use MagiC, MiNT, n.aes or other multitasking systems rather than TOS, so why you keep harping on about TOS I fail to comprehend!! At least we don't have to buy an OS as well as the computer...

Maybe you should try Linux one day too...and see actual multitasking for the first time...

My folks have Clarisworks Office 5 on their Mac (Asia/Pacific version).
The word
from Apple is that they will not make a free upgrade downloadable from their
web site for that and other nationality versions of Clarisworks. Only
the US
version is being supported currently...the other versions will NOT get an
upgrade, and it looks like you'll need to buy outright AppleWorks 5.03
if you
don't have the US version of ClarisWorks...

Sucks the big swordfish if you ask me. Fancy not supporting a piece of software
you now own...

a
> stable build of Linux on a Falcon030
>
> Thanks in Advance
>

Well, I have not installed Linux on a Falcon, but I am in the process
of installing it on my Hades, so the process should be the same.

Although there is now an unofficial port of Red Hat to the M68K
platform there are currently no installation utilities for the
Atari so your best bet would be to install the Debian distribution.

You will find information on installing Debian on the Atari platform
on their WEB site. http://www.debian.org

You will also find a list of suppliers on their WEB site so you
shouldn't have any problems getting hold of a copy. You could also
look at the Whiteline Linux CD's which are basically Debian.

http://www.atari-world.com

Hope this helps.

Regards,

Ben Hills.

With everything on the same card I wouldn't think there would be any bus speed issues, the whole deal is on one card and the slower system bus is only used for the legacy graphics subsystem and any ZorroII cards that can't be replaced by PCI cards. The bus speed can be the same as that of a Mac can it not?.

> out with the Reagan administration... what am I missing?

About 15 years!! :)

Atari themselves produced computers right up until the mid 1990's, but
clones of high end Ataris still are sold and developed today...

Here is a (small) summary of Atari computers from 1985 onward...

ATARI ST (released 1985 to 1990)
-Based on MC68000 CPU at 8MHz (or 16MHz on later Mega STe model)
-Upto 4MB of RAM.
-720kB disk drive (upgrade to 1440kB).
-mouse driven GEM desktop GUI.
-320x200x16 colours, 640x200x4 colours or 640x400x monochrome
video modes on TV's, or dedicated colour or mono monitors.
-3 voice monoaural soundchip on all, PCM stereo chip on some.
-MIDI/harddisk/printer/modem/joystick ports

ATARI TT (released 1989)
-Based on Motorola MC68030 CPU at 32MHz
-Upto 128MB or more of RAM
-increased video resolutions (1280x960x monochrome capable)
-SCSI hard disk interface as well as all other ports you can think of
-PCM stereo sound.

ATARI Falcon030 (released 1993)
-Based on MC68030 CPU at 16MHz (faster with upgrade)
-Upto 16MB RAM standard (more with upgrade)
-high-colour video capable (65536 simultaneous colour on-screen, more
with static image viewer)
-DSP56001 Digital Signal Processing chip. Capable of 96MOPS (96 million
processor instructions per second)
-SCSI-2/DSP/LAN/serial/printer/analogue joypad ports

Several TT clones are around now that range from machines using the original
MC68030 CPU but at faster speeds, to newer variants using the latest Motorola
CPU from the same family, the MC68060, which at 60MHz equals a Pentium
200 in
performance. Dual 68060 Falcon clones with high-speed DSP and more are also

being developed. The MC68060 can be clocked to around 90MHz now, but expect 120MHz versions within 6 months from the info we know from Motorola...

Atari Corp are certainly not an active business but the machines they created continue to be used by thousands, and newer variants are being developed by companies interested in the platform.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Gateway Ends Plans For Next-Generation Amiga PC

SOURCE: Newsbytes
DATE: Tuesday, September 21, 1999

--

SAN DIEGO, CALIFORNIA, U.S.A., Newsbytes via NewsEdge Corporation :
Gateway Inc. [NYSE:GTW] said it has scrapped plans to introduce a new and much- anticipated Amiga computer early next year and instead will focus on licensing the Amiga operating system to the Internet appliances market.

The announcement comes just two months after San Diego, Calif.-based Gateway, which owns the patents for the Amiga PC, promised Amiga devotees that they could expect a next-generation version of the Amiga by early 2000. The new computer, known as the Amiga Multimedia Convergence Computer (MCC), was to feature a hardware and software platform that included Internet access, digital video support, three-dimensional (3-D) graphics, broadband capabilities, and home networking standards.

But the company changed its strategy after reviewing product plans in the wake of the abrupt departure last month of Amiga President Jim Collas, said new Amiga president, Thomas Schmidt.

"To be honest, the ability for us to deliver the MCC was unrealistic," Schmidt wrote in a letter addressed to the Amiga community and posted on the Amiga Website. "I have fundamentally decided that it would be better to partner with a wide variety of hardware partners, rather than compete against them with a product of our own."

Schmidt added that he remains committed to seeking out partners which are interested in developing a next-generation computer and operating system. In the meantime, Schmidt said, Amiga will work with hardware manufacturers which want to license its technology.

Amiga officials did not immediately return calls for comment on the change in strategy.

Amiga's devoted fans were quick to express their disappointment about the news on various Amiga-centered chat rooms. "What does this new direction have to do with the original Amiga computer? Quite honestly, nothing! (I don't know) why they still need the Amiga name," read one message posted on a Czech Republic Website on Amiga news.

In 1997, Gateway bought the patents for the Amiga PC, which was introduced 14 years ago as an alternative to the IBM and Apple Macintosh computers. Sales of the Amiga, which was known for its ability to smoothly process video and sound, declined after its company, Commodore Electronics, went bankrupt in 1994.

Cows, bullshit, Gateway... what else did you expect from that Billy Boy controlled company.

Nothing has changed, Phase 5 are going to release their Amiga clone and the Boxer is already available.

Regards,

Clockmeister.

So then IBM can't copywrite OS/2? Somehow I don't think so. After
all Apple can use the name "MacOS 9" or "MacOS version 9" or
"MacOS 9.0" without violating any copywrite. Using "OS9" is using
more than just the version number.

4276. a Mac User's definition of "loser"

Newsgroup: comp.sys.atari.advocacy

here's something I found in mac.advocacy - a nice definition of those
who sorely lack lives on USEnet. Certainly reminds you of a certain
lifeless troll here, doesn't it (You know who I mean, the guy who pretends
to be an "Apple Power Rep"....)?

>Windows users usually advocate no such thing. They
merely
>believe Windows gives the best value for the general
>purpose desktop.

I'll go with this statement if modified -- many windows
users, I feel, are as comfortable with their OS/platform
choice as most mac users are.

However, you and your ilk are NOT the average windows user,
purposely coming over to "enemy territory" to perform
"pre-emptive strikes" against "those dangerous mac users".

In case you don't realize it, most us are here talking about
our platform, not in windows groups yammering about MS
software holes or wintel gotchas. Mac users who go about
doing that are at the same pitiful level as you all have
dragged yourselves to in your crusade to eliminate the use
of alternative operating systems.

4277. portable Atari with keyboard ...

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-26 00:00:00 UTC
From: galexand@sietch.bloomington.in.us
Message-ID: <7skc3lsgg1@jetsam.uits.indiana.edu>
Source record: 2840

In the movie Terminator 2, the John Connor (kid) character uses a small portable computer (looked similar to modern WinCE devices, in terms of formfactor) hooked up to a credit-card-like device to hack PIN numbers for ATMs/etc to get easy money. There is a brief flash where you can see the Atari symbol on the computer above its small QWERTY keyboard. My question is, does it exist, or is it just some sort of bizarre joke or bizarre product placement? Since I can't find any reference to such a device, I figure that Atari never made a handheld computer (Lynx doesn't count, no keyboard), but if Atari ever made such a device, I'd love to know about it.
Thanks.

Did you check the back of the reciept for the return policy? Did you ask
for a copy of the return policy? CUSA has a 14 day defective return
policy. Bring it in for a replacepent. If you want your money back,
it's a 15% restocking fee. Educate yourself and you will be a informed
consumer..

Thanks. I'll look into it. It sounds a lot like HP's line of
DOS-compatable palmtops (LX-95, LX-200, IIRC)...I was hoping for
something completely novel and not intel-based.

Well the humble Portfolio is certainly not Intel based. They use an
operating similar to DOS, but different:)

They come with address book, editor, w sheet, Diary and calculator built
in and can be connected to the external world using extra hardware;
serial port, parallel port add on's etc.

No we cannot and that is why we're happy to remain Atari users. We
don't have to put up with overbloated bullshit softwares that perform
the same number of useful tasks for your average user as a copy of CAB
or AWEB for Amiga does, yet uses 10 times the system resources...

You think we're silly? We think YOU are...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Where did I say that Gates had anything to do with the demise of the new
Amiga?.
If you're suggesting that Gates/MS doesn't enforce certain licensing
conditions upon PC manufacturers/sellers, you are the one who is stoned. In
that regard Gates does control Gateway to a certain extent.

How much does the maker of the Milan want for yesteryear's 040 /060
boxes? Maybe by 2010, a Milan PPC from the 10th owner will be reality.
By that time you should beable to get a dust infested iMac/333 for $79...

well well well. Seems TiFKAS didn't realize one of his missives wound up on comp.sys.mac.advocacy - and he got a reply from a well-known Mac defender, Joe Ragosta, that proves that we can now add the how businesses work to the other things the little pretend "Apple Power Rep" doesn't know beans about.....

> will go up...What do you want...low prices or high service and high
> prices?

Actually, that's not quite true. Changing from a commission to salary structure doesn't necessarily increase prices--or reduce service.

Let's say your average Fry's employee makes $15,000 in salary and $10,000 in commission (making the numbers up, but the actual numbers are irrelevant). If Fry's switched to straight salary and paid $25,000 per employee, their total expenses would be unchanged.

In theory, by basing the compensation package on commission, you get better sales people. In my experience, what you get are pushy people who sell crap to unsuspecting innocent people in order to make a buck.

Personally, I prefer to pay most compensation in salary with only a small commission piece. There is the risk that you'll keep the lousy sales people and lose the good ones, but I haven't found that to be the case. Pay a fair salary and you'll be OK. And fire the lousy sales people.

Of course, Fry's may want pushy sales people who mislead customers to make a buck........

you gave me evidence that didn't have any proof that they were talking
about you. And yes, you still are clueless.

Once again, provide tangible evidence, coward. Name of business. Name of supervisor. Number where he can be reached during the daytime. Should only take a few minutes to confirm....

But of course, we already know that you're a phony baloney who has proven time and time again that you have absolutely no knowledge of how the computer business operates, no less how retail works or even the standards of what the video industry works....

4299. InCompUSA Net Offer (Why I hate rebates)

Newsgroup: comp.sys.atari.advocacy
Date: 1999-09-29 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-2909991725400001@ts7-89t-14.idirect.com>
Source record: 2762

another crosspost from comp.sys.mac.advocacy:

looks like InCompUSA, already reeling from the layoff of half its workforce, is now attempting new ways to market - and as always, shooting themselves in the foot.

The result? Apple loses its major supplier in the US.

Bet TiFKAS won't be bragging about this....

Ok, I've bought a few things at CompUSA online in the past, but no more. First, they no longer accept the CompUSA credit card which offers 6 mo. same as cash for purchases over $300 (a major incentive to buy in the past), and second, they refuse to even attempt to match other mail-order prices.

What's the point?

But here's the kicker: Today, I get a special rebate offer from them for $50 off any online software purchase of $150 or more. You *download* software via Digital River, you obtain the online receipt, then you're supposed to *print* both the receipt and this winky coupon, stick it in an envelope and snail mail it to CompUSA and wait 10 weeks for a check!

Yes, I understand the psychology of rebates, wherein a percentage of schmucks never get around to sending it in, thus giving companies free money, and even those who *do* get around to submitting it wind up giving companies a zero-interest loan for 2-3 months. Frankly, between the grocery store club cards (aka "let's track every purchase you'll ever make" cards) and rebate hell, I'm not sure which is worse...

But how LUDICRIOUS is it to enact a 100% digital transaction, only to have to print and snail mail your rebate coupon? ... at least with a *physical* purchase (where some kind of packaging is involved) the rebate requires labels or POP's to be sent in. But in this case there is absolutely no need for this stuff. The only reason the user is required to snail mail the material is because it increases the likelihood that the user might delay or forget to do so.

This is so overtly tacky, I had to bring it up here in csma.

Getting up to 33% off isn't necessarily a bad thing, mind you, and some folks might happily take advantage of the offer. Personally, I'm fed up with the proliferation of rebates and this is the last straw.

Kinda like when I first heard Peaches and Herb sing "Shake Your Groove Thing" in the 70's and realize that Disco had sunk to its lowest ebb. A friend of mine and I bought one of the first "Disco Sucks" shirts in

protest (that's right, it was a custom iron-on! and we were at the vanguard of the burgeoning T-shirt-wearing masses who brought Disco to its knees! <g>)

Hmm ... "Rebates Suck." Now *that's* a T-shirt I would happily receive and wear at a trade show.

Atari apps are frequently updated and can perform many of the tasks
that you Mac and PC owners seem to think are your domain only. The
difference is that modern apps on Atari don't need stupid amounts
of system resources or high-speed machines to function. To all
intents and purposes for an -average- PC or Mac user, a fast
CPU is not nearly as well noticed when they go to use their
word-processor or spreadsheet or web-browser...

> Sounds like sour grapes...

Not sour grapes at all. Did I say I was jealous of the fact that
Netscape, W98, and IE don't work on Atari? No I didn't! Learn to
read pal!!

> By the way...Navigator and IE run just fine on my PB G3/266...

'just fine'? Why not brilliantly like APEX media or any D2D
recording software does on my Falcon? That sums Mac and PC
down to a tee...kings of the mediocre...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Its the real deal and its name is ATARI Portfolio. Its a 8086 based DOS
portable that has software in ROM and more besides...

Also look in other movies for Atari showings...a good one would have
to be 'Blade Runner: Directors Cut'. The scene where Deckard chases
a replicant through a busy city street shows an Atari shop...

ATARI...only in the best movies! (unlike PC or Mac whose showings
seem to be limited to b-grade crap movies, and then only with a GUI
that is completely removed from original!)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

You rrrraaannnnggggggg?

Yes, it's pretty much all over as far as the prospects of a new Machine is
concerned. Gateway have seen to that.
The new Amiga will basically consist of a software layer that sits on
another OS, any OS. It is supposed to provide some interface for controlling
various things over a network/internet or something.
In my opinion it ain't worth a shit... everyone else is doing that already.

Not a dignified end, but I guess Amiga the computer is now in the same
position as Atari... no parent company (to speak of).
Phase V and others are developing clones along with the QNX OS as an option.
That could be interesting.

Amiga ain't dead just yet ;-)

Regards,

Clockmeister.

Hi Darkchyld,

No Amiga, Jim Collas is gone (Amiga's best president for a long time IMO) due to a disagreement with Gateway over the future plans for Amiga. Jim didn't like the fact that Amiga was to be (effectively) scrapped, and he left/got pushed cashing in his shares in the process.

Anyway, Jim Collas still reads c.s.a.m but is keeping his head low (probably for legal reasons) showing that he did at least have some interest in the community and their hopes for the next gen Amiga.

None of that matters anymore now though. Gateway/Amiga Inc. are no longer developing a new machine or OS, just some software thing that will run on various OS's. Look for it in the bargain bins at your local PC software retailer.

Regards,

Clockmeister.

Apple just posted a Special event announcement for Tuesday Oct. 5.

http://www.apple.com/quicktime/showcase/live/appleevent99/

Draw your own conclusions. Remember Apple has three huge iMac production
facilities worldwide. Yes it would be tough for the then Atari to
announce a new model today for Christmas time frame due to their lone
garage size manaufacturing facility.

>
> well, looks like I'll soon be able to buy a Mac 7200 for $79 :)

Congrats for finaly reaching PPC before the century is out. Five years
better late than never..

Much of the Fry's are in California. You will not get much for $25,000 a
year which is considered below profesional mininum wage.. I knew folks at
Fry's on the sales floor who earned $50,000 K plus a year and they worked

their tale off to service the customer. There are bad apple's at Fry's
and elsewere but there are stars.. Retail is retail...buyer beware. A
polished customer will do their homework before entering..Customers
demand that the staff are experts on every product that the store offers
and that is unrealistic. Had one PC customer approach me in Apple land
at CUSA during my work call and asked me questions about this obscure PC
app. I had no clue and never used the product. He got all indigent and
demanded that I find a sales person that used this product. I told him
it was like finding a needle in a haystack to find a staffer that used
the product... plus that I don't work for CUSA and motioned him to look
up at the ceiling banners and carpet in Apple Land.

> In theory, by basing the compensation package on commission, you get
> better sales people. In my experience, what you get are pushy people who
> sell crap to unsuspecting innocent people in order to make a buck.

By paying low wages by the hour you get indifferent sales people. The
compensation methods are not perfect...The commission approach at Fry's
is the proper method..

> Personally, I prefer to pay most compensation in salary with only a small
> commission piece. There is the risk that you'll keep the lousy sales
> people and lose the good ones, but I haven't found that to be the case.
> Pay a fair salary and you'll be OK. And fire the lousy sales people.

Not on $25,000 a year...Even the burger flippers at the fastfoods can
make that in Calif...

> Of course, Fry's may want pushy sales people who mislead customers to make
> a buck........

Rule of thumb...Always come prepare and do your homework before walking
in a store..

> Bet TiFKAS won't be bragging about this....

First of...CUSA laid off half their commercial staff of 3,600. About
half of the laid off accepted positions in their new corporate calling
system in Dallas according the press release. CUSA currently employs
20,000 according to the press release.. Hardly half off...

Second of...What does this have to do with Apple losing it's supplier?

Indeed, that is the project which, if successfull, will put the destiny of
the Amiga computer in the hands of the users.

Offcourse, the new Phase V G4 Amiga clone looks promising as well, with the
QNX RTOS as an option it looks like an interesting combination.

Good to see the Atari clones continuing to sell steadily.

Regards,

Clockmeister.

OK Einstein...does your G3 Mac make you type numbers or letters any
quicker than a 8086 PC or 68000 mac would? The answer is (ding!) NO!
Your average dickhead isn't into graphic/video/highband audio etc apps
they just want to type emails and letters!!

Will the 68k Mac/Atari Jihad 'Chunks' deny that up north just above the MN border that economic stagnation has taken hold?

http://www.nationalpost.com/commentary.asp?f=990929/89911

Wednesday, September 29, 1999

Upsetting the Apple cart

Andrew Coyne
National Post

Ihave recently purchased an iMac, the see-through, fruit-flavoured, moulded-plastic phenomenon that, quite simply, saved Apple Computers. It's a nifty little device. It is also, inevitably, a metaphor. Be warned: Further on, I will use it as a model for how Canada might effect a similarly dramatic turnaround.

But first, a dash of reality. The tax-cut chorus is now approaching critical mass: Business, labour, social groups, all five political parties, the premiers -- all favour some sort of tax cut, if for different people, and for different reasons. The most insistent calls, however, come from those alarmed at the large and growing gap in income tax rates between Canada and the United States, and the consequences that are said to ensue: a productivity gap, an income gap, and an exodus of talent and capital in pursuit of the lower taxes and higher incomes to be had south of the border.

Whether any of these horrific events are actually occurring is a matter of some debate. It is not yet clear, for example, whether the brain drain is any worse now than it has been historically. My own view, for what it's worth, is that we are seeing the first signs of a problem that, if it is not yet evident, will get much worse in coming decades.

That's the good news. The bad news is that there is little we can do to avert this fate -- at

least, not with the remedies currently on offer. The forces at work drawing labour and capital into the industrial centres of the United States are as ineluctable as gravity, and much too powerful to be offset by a few piddling tax cuts.

The most obvious aspect of this, of course, is that pre-tax incomes are so much higher in the States, at least for those in the educated, knowledge-economy elite: the very people, as it happens, most inclined to move, and with the fewest natural obstacles. So even if we slashed taxes to U.S. levels, or lower, we still wouldn't have closed the gap.

Mind you, it's probably true, as tax-cut advocates contend, that the gap in pre-tax incomes is itself due in part to the differences in tax rates. If Canada's higher tax rates lead investors to make proportionately fewer investments or workers to supply less labour, that would help to explain our relatively poor productivity and consequent lower incomes.

Alas, that isn't the only reason. This is where the Apple analogy comes in. Canada today is facing very much the same threat as Apple in the early 1990s: a "positive feedback" loop in which an early market lead, rather than being reversible through price cuts or other conventional strategies, becomes itself a source of competitive advantage.

In Apple's case, the company had, for reasons unrelated to the quality of its product, seen its share of the personal computer market dwindle. That meant fewer software titles were published in Macintosh format, which made consumers even less likely to consider buying a Mac.

The company was caught in a death spiral, much like the one that killed the Betamax video format in the 1980s. Incremental changes would not be enough: What was needed was a product so radical, so irresistible, as to generate the sort of sudden, quantum leap in sales that alone could reverse the spiral. A product like the iMac.

The positive feedback loop that is pushing U.S. productivity further and further ahead of other countries' is very similar -- and doubly lethal to Canada. Not only are American firms profiting from the "lock-in" effect of early leads in any number of knowledge industries. It also seems that they gain advantage from sheer physical proximity to one another: The firms in Silicon Valley have a richly stocked talent pool to draw from, who can change jobs by crossing the street.

So a second feedback loop emerges, again to the United States' advantage. Firms and people go there, in part because other firms and people go there. This is not new, but with the rise of the knowledge economy, it is more pronounced. And it is potentially devastating to Canada.

Like Apple, we can no longer rely on incremental strategies, i.e., tax cuts. To turn things around, we need the policy equivalent of an iMac: something so startling, so extraordinary, as to compel footloose capital and labour to once again give Canada a look. Do I have one? Yes I do. Abolish the income tax.

Don't get too excited: The same revenues would still have to be collected somehow. To replace the $100-billion or so the federal government raises every year in personal and corporate income tax would mean increasing the GST to about 35%. But think of it! No tax return to fill out. No tracking of expenses, no calculation of capital gains or accounting for depreciation. And no tax at all on income you don't spend.

I realize this is an idea that requires more than one or two paragraphs to develop. The point here is only that we need to expand the tax-cut debate, if we are to counter the pull of American economic gravity. We need to think big. Or to borrow a slogan, Think Different.

The mac spin: http://www.applelinks.com/mooresviews/coyne.shtml

iMac-Using Pundit Cites Apple's Turnaround Strategy As A Blueprint For Addressing Canada's Economic Distempers

By Applelinks Contributing Editor Charles W. Moore

Respected Canadian political and economic affairs columnist Andrew Coyne has recently joined the ranks of iMac users, and this week used Apple's iMac-driven turnaround in his latest National Post column as a metaphor for how Canada might also reverse its current national economic distempers -- especially those related to Canada's punishing tax rates.

Mr. Coyne notes the large and growing gap in income tax rates between Canada and the United States, and its widely-alleged consequences including a productivity gap, an income gap, and the famous "brain-drain" that sees a significant proportion of Canada's best and brightest exit south each year in pursuit of the lower taxes and higher incomes.

Mr. Coyne thinks, and as a fellow commentator on Canadian public affairs I heartily agree with him, that these problems are going to escalate if they are not effectively addressed by drastic reforms.

Half-measures will not do. As Coyne puts it, "The forces at work drawing labour and capital into the industrial centers of the United States are as ineluctable as gravity, and much too powerful to be offset by a few piddling tax cuts."

And this is where Coyne's iMac analogy kicks in. "Canada today is facing very much the same threat as Apple in the early 1990s," he writes, noting that in those dark days of 1996-'97, Apple had seen its market share erode, resulting in less software being published in Mac format, which made consumers even less likely to consider buying Macs, which made it even less attractive for developers to write Mac software.

"The company was caught in a death spiral," says Coyne. "Incremental changes would not be enough: What was needed was a product so radical, so irresistible, as to generate the sort of sudden, quantum leap in sales that alone could reverse the spiral."

That product was of course the iMac, which as Apple-watchers know, catalyzed one of the most dramatic turnarounds in corporate history.

Coyne asserts that Canada is currently in a situation not dissimilar to Apple's in the mid-'90s. "Not

only are American firms profiting from the 'lock-in' effect of early leads in any number of knowledge industries," he notes, but it appears that they benefit substantially from sheer physical proximity to one another.

Consequently, as with the chicken-or-egg matter of Apple market-share and third-party software development, high-technology companies and personnel tend to locate in places like Silicon Valley, in part because other high-tech firms and people locate there. This dynamic with regard to software development was potentially (and near-actually) devastating to Apple, and it is likewise potentially devastating industrially and economically to Canada. For instance, only 15 per cent of Canadian manufacturing is currently based in technology, compared with 35 per cent of the U.S. economy.

Andrew Coyne maintains that it's too late for incremental strategies such as modest tax cuts to help Canada's technology investment deficit and general economic competitiveness. Because U.S. pre-tax incomes are already so much higher than in Canada that even if Canada slashed taxes to U.S. levels, it would still fall far short of closing the gap. "To turn things around," he says, "we need the policy equivalent of an iMac: something so startling, so extraordinary, as to compel footloose capital and labour to once again give Canada a look."

So what is Coyne's iMac-esque prescription for fixing Canada's economic death spiral?. Abolish the income tax. Well, he said it would be startling! But would it work?

Coyne suggests that in order to replace the Can$100 billion or so that Canada's federal government raises annually through the personal and corporate income tax system, it would be necessary to increase the federal Goods and Services value added tax (GST) from its present 7 percent to roughly 35 percent, which probably sounds awful to most people, but the payoff would be that no one would have to fill out tax returns, record expenses, calculate capital gains or depreciation allowances. The national increase in efficiency in a lighter red-tape and paperwork burden alone would almost certainly boost the GNP a few points. There would be no income taxes deducted from paychecks -- personal income would be yours tax-free until you spent it. And you would not be

taxed at all on money saved.

Proving himself a master of understatement, Mr. Coyne acknowledges that "this is an idea that
requires more than one or two paragraphs to develop."

True enough, and there are also a number of other significant issues besides high taxes kneecapping
Canada's economic competitiveness -- for example the fact that 33.1% of Canadian workers belong
to labor unions, while less than 15% of U.S. wage earners are unionized. The rate of unionization in
the Canadian public sector is 71%, with 18% of Canada's private sector workers unionized,
compared with only 11.8% of the U.S. private sector labour force .

Canada also has one of highest strike rates in the industrialized world, averaging 407 strikes per
year between 1990 and 1996, compared with just 38 in the United States, 191 in Japan and 306 in
the United Kingdom - - all countries with much larger populations. Small wonder that Canada
struggles to keep its head above the increasingly rough waters of international competition.

Successive Canadian governments have irresponsibly attempted to wallpaper over the productivity
gap through that time-honored method of propping up failing economies -- currency devaluation --
which is why the Canadian buck, which traded at more than par with the greenback in 1976, is now
worth about 68 cents, up a bit from its all-time nadir of 63 cents in the summer of 1998.

Still, I like Andrew Coyne's income tax abolition idea. Unlike many GST- hating Canadians, I have
long believed that value added taxes are a much superior vehicle for raising necessary government
revenues than the income tax so beloved of leftists, whose ideological orientation is to punish "the
rich" and "big multinational corporations" with confiscatory income taxation. As for the argument
that a flat value-added tax is not progressive and therefore discriminates against the poorer members
of society, there are already graduated GST rebates in place that could be adjusted and enhanced to
compensate for the burden a 35% value-added tax would place on lower-income people.

In any event, the present system is not working, folks. Canada has had the lowest productivity
growth of any G7 country for the past 25 years, and continues to slip

farther and farther behind her
G7 partners in standard of living. Canadian real per capita income is
about 25 percent less than in
the U.S. A Canadian Imperial Bank of Commerce study recently found that
Canadians are earning
$900 Cdn. a year less per capita in real terms than a decade ago, while
American disposable income
has risen by $2,200 US per person over the same period.

Since 1996, annual U.S. pay increases averaged 2.0 per cent after
inflation, compared with 0.2 per
cent in Canada. Had Canada kept pace with U.S. productivity growth
since 1979, Canadian per
capita real income today would be more than $7,000 per year higher.

Canada's labor cost per unit produced rose 99 percent between 1978 and
1991, versus just 62
percent in the U.S. (the Canada/U.S. dollar exchange rate was the same
at the start and end of that
period, so currency fluctuations weren't a factor in these data). That
amounts to a 37 percent
widening of an already significant productivity gap over one decade.
Canada can no longer afford
such inefficiency. Actually, we never could, as our 68 cent dollar
indicates.

The Organization for Economic Cooperation and Development has warned
that Canada's standard
of living will fall sharply during the next 20 years unless we clean up
our act. "We must work to
sensitize Canadians that [productivity] is an issue that really matters
and our standard of living, and
that of our children, is very much at stake," commented Canadian
National Corporation CEO Paul
Tellier recently.

In a recent special issue focusing on Canada, The Economist magazine
pointed out that Canadians
should not resist a "growing recognition" that demands for lowering
taxes, cutting national debt, and
narrowing the productivity gap with the U.S. are reasonable. The
Economist cautions that Canadians
will have to become more like Americans to survive in an increasingly
competitive world economy.

Even a Canadian government policy paper on productivity by the federal
Department of Industry
acknowledges Canada's pathetic productivity performance, and paints a
grim scenario of a country
in danger of becoming a low-wage appendage to the U.S. -- "hinterland
status" -- unless we can

clean up our productivity performance.

Given these sober evaluations, Andrew Coyne's "iMac fix" for Canada's economic ills is neither
extreme nor outlandish. As he summarizes: "The point here is only that we need to expand the
tax-cut debate, if we are to counter the pull of American economic gravity. We need to think big. Or
to borrow a slogan, Think Different."

Just sinclap...

Jean Cretin doesn't care - he is encouraging the 'whiners' to leave !

Snipped for the sake of brevity

One has only to look at the UK after the 'Thatcher Revolution' which the following governments, even New Labour have not changed - unemployem is at less than 1% and things seem to be economically good - but then we can't compare Canada to a 'real country' can we ???

A 'Country' that cannot, and does not, respect its own borders is not a real country - it is an aggregation of land which will eventually become a real country once populated by people who do really care about it !!!

I find that really sad !

The Canadian Curmudgeon (in snowy Calgary)

There is a movie called "Office Space" out on video in the U.S right
now, in one scene a man is waiting for a really large file to save so he can
shut down his computer.

It is a Mac GUI and I even think the Apple menu is visible, but when he
shuts it down it goes to a c:\ prompt!

> The 68k Mac Jihad 'Chunks' Spoke....

looks like TiFKAS is hallucinating again, he's imagining his imaginary friend Chunks, who's never existed, is replying to him. A sure sign that he's losing an argument before he's started....

Please also note the fact that he is claiming that a Macintosh is junk with his sneering putdown of a Quadra 950 - according to just about every Mac person I've talked to, a Quadra 950 (this is one of the first Mac server models) is a pretty powerful machine despite its older chip, and a pretty cool machine to be running...

> You're twisted mind is seeing conspiracy thats not there.
^^

spelling, spelling, TiFKAS. They're spelled "Your" and "that's". More proof that Apple's employment department would have given you the bum's rush the moment you put crayon to paper...

And since when is well thought out reply to your drivel is considered "conspiracy"? We all know your own paranoid rantings about "Atari Jihads" shows who's the real conspiracy nut....

Joe and I have
> a difference of opinion. I am not saying thats he is right nor wrong..

because you can never admit you are wrong, can you, chucklehead? Just like you can't admit you were wrong about supporting "Tubby" Black's unresearched articles?

> >
> > Actually, that's not quite true. Changing from a commission to salary

>
> Much of the Fry's are in California. You will not get much for $25,000 a
> year which is considered below profesional mininum wage..

cite, please. And it's spelled "professional", which you are not.

I knew folks at
> Fry's on the sales floor who earned $50,000 K plus a year and they worked
> their tale off to service the customer. There are bad apple's at Fry's
> and elsewere but there are stars.. Retail is retail...buyer beware. A
> polished customer will do their homework before entering..Customers
> demand that the staff are experts on every product that the store offers
> and that is unrealistic.

what is unrealistic here is TiFKAS' claims that he is an Apple Power
Rep. His major mispellings alone in the above paragraph are enough proof
of that.

One thing about my business that we often get complimented on is the
amount of knowledge and understanding of the product we can pass on to the
consumer, due to training, trade shows and simply studying the labels of
the products before the consumer asks the hard questions. Why should we
expect less of the salespeople who sell us computers or software?

Had one PC customer approach me in Apple land
> at CUSA during my work call and asked me questions about this obscure PC
> app. I had no clue and never used the product. He got all indigent and
> demanded that I find a sales person that used this product. I told him
> it was like finding a needle in a haystack to find a staffer that used
> the product... plus that I don't work for CUSA and motioned him to look
> up at the ceiling banners and carpet in Apple Land.

more spelling mistakes. It's spelled "indignant". And who are you to
make assumptions about what the staff at that particular store did and
didn't know?

The only true part of the above was "I didn't have a clue", which you
NEVER had, chucklehead....

nope, TiFKAS is too dense to understand that fine paper, he instead turns to his favorite misinformation rag the National Pest (a.k.a. the Daily Tubby), run by well-known right-wing loony and Augusto Pinochet apologist Conrad "Tubby" Black, who is much the same bully and crybaby as ol' TiFKAS himself. The same paper that ran the article TiFKAS crowed that the "iMac was all sold out up North!", only to be proven dead wrong after my poll of different stores in Toronto last March which showed just how little their reporters did their homework.

A note, TiFKAS - you may want to know that "Tubby" encourages his reporters to have the same neanderthal views that he espouses. Which is why the Daily Tubby is considered a laughing-stock. Indeed, a recent ad that the Tubby has been running here on billboards in Ontario, showing a dog peeing on a Tubby newsbox, ironically reflects how Canadians feel about this idiot and his world-view...

>
> > Further on, I will use it as a model for how Canada might effect a
> > similarly dramatic turnaround.
>
> Not while the Liberals remain in power - kept there by the 'Sheep
> populating Ontario' !!!!

no, it's just that we're too smart to fall for the empty rhetoric of Preston Manning, he of the rapidly shrinking credibility especially after his immigrant-baiting rhetoric here in T.O. and last night's historic Tory meeting where 95% of their membership rejected Manning's UA scheme. No, Preston, we're not "out of touch" here in Ontario. Just because Mike Harris got another 5 years in power here doesn't mean we're THAT stupid....after all, we, by turfing many of Harris' ministers (many of the same idiots who started many of the problems we still have here like labour relations), and re-electing Harris' biggest critic, Gerard Kennedy, by a landslide (which I as one of Kennedy's constituents helped to do :)) has shown Harris it's not going to be "business as usual" in selling out Ontario to big business.

Still, there's one thing we can agree on - it's hilarious that TiFKAS feels so threatened by his biggest critic that he has to attack an entire country - forgetting, of course, what happened the last time the US underestimated Canada in an attack (does the image of a charred and destroyed White House in 1814 give you any clues, pinhead?)

Note too that he's not bragging about Jesse "The Baby" Ventura anymore - probably even he's realized that Ventura has made Missouri voters the laughing stock of the US after unashamedly whoring himself out to the WWF again...

Us Atari and Amiga users are the fortunate few that are enlightened enough to know that Atari and Amiga where the platforms to kickstart the audio and video revolution in media.

Others will continue to believe the Wintel version of history... unfortunately.

There was also another paper that had a similar article. It depends on
your diffinition of sold out.. iMacs in Apple's warehouse and
distribution channel were flushed out. Stores did have very low stocks
at the time...And Apple did sell a half-million during the quarter...

I did not attack Hollywood's backlot up north. Just forwarding a columinists take on the sorry state of the Hollywood's back lot economic situation..

> Note too that he's not bragging about Jesse "The Baby" Ventura anymore
> - probably even he's realized that Ventura has made Missouri voters the
> laughing stock of the US after unashamedly whoring himself out to the WWF
> again...

He is guv of the state of Minnesota located down south...Which is in much better financial condition than the Hollywood back lot up north. Did you know that the state had instituted this year due to the huge budget surplus a sales tax and renter's property tax refund? I missed out since I moved last Nov. Were for the '97' filers....I should get back $600 for'98' and $1000+ for '99'..

True. Try being product professional on 10,000 products..

Studying the labels is not going to tell the customers beans on how it
operates. The customer in question though all the sales person had this
obscure app on their harrdrives at home and knew it inside/out.. Yea
right..

Yep...Allows me to incorporate text, grapphics and excel work into
PowerPoint vice versa. Can't do that on the 8086 and 68000. MS does
need to improve PowerPoint to make it run better. Maybe Corel will
release their Mac Office 2000 to give MS competition. IS there something
equivelant on the TOS side?

I think you've missed my point. Sure you can import data, graphics, text
etc...into PowerPoint (after all it is a presentations program), but does
owning a G3 enable you to create all that >TYPED< original data faster?

My point is that many users just want to type emails and letters...owning
a brand new fast Mac, PC, or Milan060, will not help them create these
kind of documents dramatically faster than say a 68030 Mac or 486 PC...

The answer almost surely is NO! Unless of course you've gotten real good
at typing...

I aim to have a Milan with 060 sharing a big SCSI disk (bus arbitration)
with my Falcon. I can use POV-ray on the Milan to render 3D animations
and then use APEX media on the Falcon to create hi-colour animations
that can be played to VHS video via the Falcons standard composite
video out...a nice budget video titling setup...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi!

> If anyone has installed Linux on a Falcon030 I could use your guidance.

I was installed Linux on my F030 few days ago ...
In DEBIAN distibution (2 CD's) it's very easy to install Linux, but you
need math coprocesor and 14 MB of RAM.

> I am looking for HowTos and FAQ's/Walkthroughs on installing and make a
> stable build of Linux on a Falcon030

It's included on 1ST CD of distribution.

>
> There was also another paper that had a similar article.

knew that TiFKAS would try that again - and again, as I pointed out,
the Montreal Gazette also did not do their homework.

It depends on
> your diffinition of sold out.. iMacs in Apple's warehouse and
> distribution channel were flushed out.

first, it's spelled "definition". secondly, according to my brother,
Apple still had lots of 233mHZ Rev. B iMacs in stock during the whole of
March - unlike you, my brother has direct access to Apple's warehouse in
Cupertino and knows what is in stock.

Stores did have very low stocks
> at the time...

BZZT! Wrong! In Toronto there was a veritable glut of them during the
"sold out" period, and many stores still had Rev Bs, which they were
trying to blow out at greatly reduced prices - indeed, a Computer City
employee told me that the articles were "greatly overstated".

>
> > A note, TiFKAS - you may want to know that "Tubby" encourages his

> > about this idiot and his world-view...
>
> So you are disputing the claim that CA is in rough economic time?

gee, ask Benjamin Netanyahu - he was on record today that Canada is doing "extremely well" when he came to visit today. And we're doing well enough that our Prime Minister announced today that he's putting in new investment in our universities and sciences, and mentioned that there's going to be some major tax cuts. Hardly the actions of a country having a rough economic time. You should try reading real newspapers instead of kissing Tubby's butt to try to cover the fact you picked the wrong newspaper to base your groundless claims on....

>
> So why did 'Newt' Harris get re-elected? Must have high public aproval
> rating?

no, more vote-splitting between the two opposition parties - the Tories actually lost the popular vote. Of course, Harris had to use dirty US-type politics to paint the opposition leader as the provincial boogeyman...

>
> > Still, there's one thing we can agree on - it's hilarious that TiFKAS

>
> I did not attack Hollywood's backlot up north. Just forwarding a
> columinists take on the sorry state of the Hollywood's back lot economic
> situation..

first, it's spelled "columnist". Time to re-attend remedial first grade.

secondly, "Hollywood backlot up north!" ROTFLMAO! got news for you, TiFKAS - the Canadian movie industry is a separate concern that is doing so well that the Hollywood community is actually trying to get its actors,

cameramen, etc. to not go to Canada to work, because it's actually draining dollars from the US film industry! May I also tell you we have some of the most powerful and influential companies in the entertainment industry like Nelvana, Mainframe, and Alliance-Atlantis (does the words "Roberto Benigni", LIFE IS BEAUTIFUL and "Oscars for best picture and best actor" ring any bells?)

thirdly, any search for your steaming piles of drivel on Dejanews will uncover scores of times you've attacked Canada as a last resort when it was obvious you were losing a debate, including calling it "the northern US territory" - you've done the same to New Zealand with your drooling jingoism when Chris nailed you to the wall. Another attempt by TiFKAS to rewrite his own history?

>
> > Note too that he's not bragging about Jesse "The Baby" Ventura anymore

> I moved last Nov. Were for the '97' filers....I should get back $600
> for'98' and $1000+ for '99'..

again, TiFKAS - the average person on the street thinks Jesse "The Baby" Ventura is an overgrown infant who is a laughingstock as a politician. And may we now add "bigot" and "idiot" after last weekend's revelations about that interview.

and as for your economic forecasts - telling a lie over and over doesn't make it true. It's not working for Tubby, and it's never worked for you....

> cabbies...Ring a bell?

does THIS ring a bell, TiFKAS? In a recent MacAddict, a reader said he
was about to order a new product from a company when he noticed a spelling
mistake in the ad - and he figured, if they caouldn't even get their ad
right, why bother? The same when dealing with you.

>
> > And since when is well thought out reply to your drivel is considered

> What makes you think they were not researched? The ball is in your
> court. The economic indicators are not state secrets...

because I actually went and looked, chucklehead. I called the stores.
THERE WERE PLENTY OF iMACS FOR SALE THROUGHOUT THE MONTH OF MARCH. It was
obvious that the article was based more on an Apple press release than the
reporter actually doing legwork...

> > >
> > > Much of the Fry's are in California. You will not get much for $25,000 a
> > > year which is considered below profesional mininum wage..

>
> Here in MN...Burger flippers and the folks at Starbucks can start out at
> $8 HR plus overtime...Do the math... Imagine what the wage rate is like
> in Calif..

uh, TiFKAS - $8 per hour x 40 hrs per week x 52 weeks = $16,640 gross
income per annum, a shortfall of at least $8,360 of what you claim - did
we not forget things like employment insurance, taxes, pensions, etc.?
That certainly whittles down the take-home pay....

wage rate in California? most likely the same across the board all
across the US.

this economic report brought to you by iCalc, now in 68k :)
>
> I am not a proffessional? How do you know...? Do you know me? Are you
> a professional?

I know you well enough to know you certainly don't ACT professional.
You can't even SPELL professional.

I am professional, and take great pride in being so at my work.
>

A certain 68k Jihad claimed it was too late for Apple to release new Milan crunching G3 iMacs for the Christmas quarter. Once again the chunky soup turns cold while Apple's worldwide manufacturing will churn out tens of thousands per week of these awesome sucessor to the popular iMac..

"The iMac has been the biggest computer launch we've seen in our history. Apple is back, and iMacs are flying off CompUSA store shelves
across the United States."
James Halpin, president and chief executive officer of CompUSA

Depends what kind of apps your using. I need the best because my job
demands it. I use PP, word and excel....so I need decent hardware..10
year old macs and pc's will not do it..

I can attest that I would never want to create another document again on
a 68030 Mac. I can't run Word 98 on that Mac..

Here in the U.S. the new $999 iMac can be had for $599 if you sign up for
a Compuserve three year sign up.. The specs for this BB/350 are:

350-MHz G3 processor with a 100-MHz system bus, a RAGE 128/AGP 2X
graphics processor, 64MB of RAM, a 6GB hard drive, two USB ports and a
56-Kbps V.90 internal modem. It will also feature optional AirPort
wireless networking capabilities. Plus the speakers are Harmon Karden, a
nice touch..

> The answer almost surely is NO! Unless of course you've gotten real good
> at typing...

On the older boxes...Would have to wait for the cursor to catch up..Plus
my software would not run off it..

and, as I pointed out, the articles were WRONG. I found many of the
iMac YUCKs in stock. At the Computer City where the employee said the
Tubby article was GREATLY OVERSTATED, they had ALL the colours in
plentiful stock. Rev Bs were also in plentiful stock. We are talking about
what was going on THEN, not NOW.

the fact is that the article claimed that the fruit-flavoured iMacs
were sold out or in short supply in Canada in March. My research proved
different. Or does the Tubby not consider Toronto a part of Canada?

>
> You sound like a sore loser..

nope. When Harris resorted to "boogeyman" attack ads againts the
Liberal opposition leader MONTHS before the election was called, I would
call that sort of behaviour unfair.

Besides, like I said, Harris lost a lot in this election - many of his
key cabinet ministers, the ones who made all the bone-headed decisions
regarding unions, education, welfare, were soundly defeated. And Gerrard
Kennedy - Harris' biggest critic - was re-elected in a landslide after
Harris tried to parachute a former Liberal into the riding to try to
defeat him. Not to mention Harris wound up losing his wife a month ago, in
part to his infamous temper and bullying tactics, and in part to the fact
that Janet didn't want him as premier again...

The X-Files stopped production in Vancouver because David Duchovny was
homesick for LA and his wife and pressured Chris Carter to move the show
to Hollywood. The decision had NOTHING to do with Canada's economy. This
was in all the papers and news reports up here. Duchovny himself says he
has nothing against Vancouver or British Columbia, and thinks it is
beautiful country up here.

Really, is that the best you can do, TiFKAS?

sorry, we don't have drooling dragging-their-knuckles cretins with
negative IQs in Ontario, that's why the Reform Party got skunked in the

last federal election :)

>

there's a big difference between disagreeing and being a bigot, TiFKAS.
For your information, I've done my own work in fighting against bigotry in
Canada for many years, including against Catholic-haters, Nazis, and gays.
I've even refused to serve customers who made ethic slurs against my
co-workers (with the support of my bosses, BTW). Compare this to Mike
Harris, who once compared a legitimate protest to an Iranian Jihad (sound
familiar, TiFKAS?) and was forced to apologize to the Iranian community
and the protestors.

Your claiming that I'm a bigot shows that you've now hit an all-time
low, TiFKAS. And your trying to white-wash Jesse Ventura's unacceptable
and brain-dead slurs shows that you have some issues that deeply need to
be tended to. Maybe they should round up all the bigots, and send them
back to bigot-land from whence they came? :)

>

strangely enough, TiFKAS, the low dollar we've learned to live with
quite nicely. Thanks to it, we're enjoying high export levels, our tourism
industry is way up, and many car plants have been put up by the Big Three
and Japanese firms because it's cheaper to produce cars here. In fact,
American tourism is hurting so bad that Texas and, recently, Pennsylvania
announced campaigns to tourists from Canada to visit their states and -get
this- they're so desparate they're going to accept our money AT PAR.

I'm sure that the Curmudgeon will have his own take on the idiocy of
Conrad "Tubby" Black....

and who will soon regret saying that if he decides to run for
President. Could you imagine how Ventura will react when his opponent
dredges that back up in a debate? That won't go over very well in the
Bible Belt, fer sure -

<Church Lady mode ON>

what inspired Ventura to put his foot in his mouth like that, could it
possibly, yes could it possibly be (reverb on) SATAN? (/reverb off).

<Church Lady mode OFF>

thanks for confirming that even you think that the Daily Tubby isn't
even good enough to line budgie cages with. More answers in the form of a
question in the new Jeopardy category, "Things Sinclap Doesn't Know What
The Hell He's Talking About" :)

Here in Toronto we refer to the Globe as the Glib & Flail.

Personally I prefer the Toronto Star, they're not afraid to pull
punches. And the Sun gets in some great stuff, that is as long as they're
not brown-nosing themselves to Harris.

And let's not forget Frank! They're the thorn in the side of everyone,
especially "Tubby" Black. One thing I wonder is how Frank managed to find
that picture of TiFKAS for their subscription ads - I guess TiFKAS didn't
see the cameraman, seeing as he had his head buried in, ah, a "prone
position" at the time...

>
> Or as one wag puts it "There are 12,000,000 sheep in Ontario. The

Hi, I have 5 Atari items for sale. To make things fair for everyone,
I posted them on E-bay, so that everyone will have a fair chance.

Here's the stuff:

Atari Computer Power Supply, +5v, -12v, +12v
Atari Replacement ST Keyboard, BRAND NEW!!!
Atari "Side Board" for 810 computer NEW!!
Atari Power Adaptor Part No: C018187 11.5vdc
Atari 9 Volt AC Supply Part No: C017945

Go to this shortcut to get to my e-bay items.

http://www.elpro.com/img/

All of this stuff is in new or like new condition. Power supplies have been
tested.

Good luck.

Uh.. HELLO?!? I don't work for Avid.. I have FCP and Xpress Mac.. I don't care which system I use. Why would I give a damn?

My only issue is with morons like you who pretend FCP, right now, is impacting Avid's business.

Hi there,

sinclap wrote:
>
> You sound like that Macs and wintel boxes cost an arm and a leg...

No I don't. You are sideskipping the issue, which is about whether
average email sending, letter typing PC or Mac owners really do
need a fast machine just to accomplish these -oh so heavy- tasks...

PC's and Macs are cheaper than ever...which is completely unable
to be contradicted...

> > My point is that many users just want to type emails and letters...owning
> > a brand new fast Mac, PC, or Milan060, will not help them create these

> Depends what kind of apps your using. I need the best because my job
> demands it. I use PP, word and excel....so I need decent hardware..10
> year old macs and pc's will not do it..

It is your job, and having come from a corporate oriented company that
demanded much from me, yes the best is the only standard I'd be expected
to adhere to. But a novice home user isn't under such pressure. My partner
is completing a diploma which includes computer content (she's a real PC
novice), and the lecturer suggested she buy a PC to keep her PC skills
up once the course of study was complete, but he gave a card leading her
to a retailer who would have sold her a US$1250 Pentium III system with
64MB RAM, ATI Rage II graphics etc...all she needs is a basic machine with
which to hone the skills she learnt on the course. A basic older Pentium
with Win95 and Word 6 would suffice...second hand probably. She has no
interest in games or graphics apps, so why should she waste the best part
of US$1250 when she could get a working machine 2nd hand for about $200?

> On the older boxes...Would have to wait for the cursor to catch up..Plus
> my software would not run off it..

Thats only if you try to run newer software. Older versions of the same
software, as I have said, would suffice for many...

> > I aim to have a Milan with 060 sharing a big SCSI disk (bus arbitration)

> > and then use APEX media on the Falcon to create hi-colour animations
> > that can be played to VHS video via the Falcons standard composite
> > video out...a nice budget video titling setup...
>
> How about the cheaper iMac DV set up that includes iMovie?

Then I couldn't run APEX media, or D2D software I'm familiar with!
I'm not interested in going into business here...just in making a
title or two for some of my holiday videos...

BTW, with your knowledge of macs, do you know of a mac app that will play
16-bit FLIC animations (.FLH) as created by Autodesk Animator and APEX
media?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

There is a movie called "DELUSION" that came out around 1991. It features an Atari Stacy as a new computer design that will "revolutionize the industry". And also in the film, on the lead character's desk is an ST. And of course Atari Corporation is credited at the end for supplying all computers in the film.

And the movie is pretty good as well. It was released by a company called CINEVILLE. You might be able to find it at your local video store if you look hard enough.

4353. Microsoft & TiFKAS Scared about Linux!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-10-11 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <dreibel-1110991348360001@ts7-57t-28.idirect.com>
Source record: 2716

found at comp.sys.mac.advocacy:

many times, The iDiot Forever Known As Sinclap has crowed over and over
that Microsoft was not afraid of Linux encroaching in their territory
despite its growing popularity.

Well, looks like TiFKAS is about ready to choke down a whole bowl of
his much-hated strained spinach, judging by the FUD being put out by
Microsoft about Linux. And well they should try a pre-emptive strike,
seeing as how well Red Hat is doing both on the stock market and in sales
against Windows NT in the server market. Indeed, Red Hat actually OUTSOLD
NT in July.

yes folks, Microsoft IS scared about Linux.

(insert picture of Bill Gates yelling "sweet merciful crap!").

Please also note that nice things were said about Macintosh - shows you
that I am an equal opportunity OS user :)

At first I just kept this note as a reply in its original lists. But then
I say crap like this being foisted on folks:

"Summary The Linux operating system is not suitable for mainstream usage
by business or home users."

This is a quote from Norman D. Megill (ndm@shore.net) in his moronic note
"Microsoft shatters Linux myths." This line is a DIRECT QUOTE he lifted
from the Megalosoft site listed below. In fact you will find it at the end
of the full quotation I have provided here.

Permit me Norm to shatter YOUR myths:

Michael Wicklund <tbogard1@MYhome.com> wrote in message
news:37FECCB5.44073BEB@MYhome.com...
> I think this is old but it's worth the attention. Check it out:
> http://www.microsoft.com/ntserver/nts/news/msnw/LinuxMyths.asp
>
> It seems that Micro$oft is afraid of Linux.

| Summary
| The Linux operating system is not suitable for
| mainstream usage by business or home users.
| Today with Windows NT 4.0, customers can be
| confident in delivering applications that are

| scalable, secure, and reliable--yet cost
| effective to deploy and manage. Linux clearly
| has a long way to go to be competitive with
| Windows NT 4.0. With the release of the Windows
| 2000 operating system, Microsoft extends the
| technical superiority of the platform even
| further ensuring that customers can deliver
| the next generation applications to solve their
| business challenges.

Let's sort out a few things simply reviewing the inane summary Megalosoft give us here:

1) Windows NT is NOT scalable in the conventional sense. Once you hit 25 machines on a network its toasted. This figure was determined by InfoWorld magazine. STUPID Eastman Kodak believed this total drivel from Megalosoft and vowed to have all of the company, worldwide, moved over the NT 4 by October of 1996. Megalosoft provided on-site staff to assist in the change. It never happened. Kodak gave up and went back to a backbone of, guess what, UNIX. Nice Lie Megalosoft.

2) Windows NT is NOT secure. Every single week a new Megalosoft security bug is revealed. They show up in every application that uses their horrifying macro language. They show up in their eMail programs. They show up in their browser. And lord help you if you haven't noticed that they show up regularly in Window NT. This week a new NT security hole was found, and this is AFTER 5 (F-I-V-E) service packs. The US Army got so fed up with the security failings of Windows NT on their webserver that they switched over to Mac OS using WebStar. Again: Nice Lie Megalosoft.

3) Windows NT is NOT reliable. Validated reports have proven that the failure of NT in the Navy has left at least one of their ships dead-in-the-water. InfoWorld recommend bringing down NT servers every weekend so as to avoid unexpected crashes. The average uptime for NT 4 is less than two weeks. Yet again: Nice Lie Megalosoft.

4) It has been shown the Megalosoft LIED when they said their Windows 2000 server was hit by lightening or suffered power transients during their security tests on the web. What flatout happened was the OS was so unstable that they could not keep it running. So much for hopes of improvement in the next generation of Windows. But I am sure we will hear further Nices Lies from Megalosoft to the contrary.

5) Business has already proven itself to be horrendously computer illiterate. Statistics have PROVEN that if businesses were based on Macintosh computers instead they could cut their costs of computer setup, training and support by a factor of 4, according to INTEL! Johnson and Johnson watched their computer install, training and support budget balloon by a factor of 10X (T-E-N T-I-M-E-S-!) when they switched from Macintosh to PC. Shoot yourself in the head! Nice work!

6) NT is a Megalosoft failed attempt to bring UNIX to the PC under the Megalosoft brand name and accompanying profits. It is THAT SIMPLE. And here they are LYING about how poor UNIX is (AKA Linux!!!!) when they are in fact suffering from UNIX ENVY! It is all too hilarious.

Next time you believe what Megalosoft tell you:

Go have some tea, take your Lithium, get a good night's sleep, and everything will be better in the morning. Just keep telling yourself where you DON'T want to go today: Insane.

Does anyone use a hard drive compression utility similar to those found in the PC world? My 40 meg HD on my Stacy 4 is getting pretty full. If there are shareware or freeware ones out there that would be great. I think there was a commercial program written by Oregon Research but I'm not sure where I'd get it or what it was called.

Thats pretty f**ked up drivel. I sadly see this in MOST PC magazines these days. What a bunch of corporate kiss-ass f**kwits. I am certain that these guys are either tripping on bad acid, or Micro$loth are reaching into their pockets to 'support' this drivel. These journos are probably under contractual obligation to NOT say anything bad about NT, even though that means they'd be lying...

Linux network installation companies are sprouting like spring flowers in southern hemisphere October when I read the daily newspaper here. I haven't seen as many NT network 'experts' extolling their 'superior' support in the ads recently either...this is the beginning of the end for NT based networking, as finally businesses have the choice to make as to networking solutions. That choice is no longer NT...

My Mac spec...likes the new iMac....

Always a bridesmaid, but never a bride: hands-on with iMac
DV SE
Special to theiMac.com by Rodney O. Lain
10/10/1999 - Rodney O. Lain

"Sweeeeeet."

-- Eric Cartman, "South Park"

I don't own an iMac, let me make that clear. So, how can I write about
it, then?

Well, the reason I'm in no rush to buy one is because I get to play with
them whenever I want,
for as long as I want

And tonight, I wanted to.

Out of the box

I went into the CompUSA tonight (Friday) to set up one a G4 display. We
were also to set up the
iBook demo machine, but couldn't since we didn't have any in stock. I
was surprised to find a
good number of customers milling around the Mac section. One lady wanted
to see one of the
new iMacs, so I suggested that I could bring one out, since I just saw
that we had several of the
iMac DVs and DV SE's in stock.

"Oh, you don't have to do it for me," she countered.

"Oh, I'm not," I replied. "I'm doing it for me."

She wasn't offended. She smiled, understanding my excitement. (By the
way, I don't normally
speak so straightforwardly with every customer, but most Mac customers
are more relaxed and
more willing to laugh and share in my giddiness.)

Anyway, as the Apple rep (who suggested that we set up the demos) dealt
with arranging the
B/W G3 towers (to the back of the section) and setting up the G4 demo
(at the front of the Apple
store), I went to grab an iMac.

Decisions, decisions. Should I get an blueberry or an graphite machine?
Graphite, yes.

Upon opening the box, I could tell that Apple took as much care at
packaging and packing the
product as creating it. Clear, shrink-wrap plastic covered the iMac's
handle, monitor and other
vital parts. I unwrapped it and pulled it out, noticing immediately that
it really is lighter than the
previous iMacs -- and I should know, for I've carried my share.

There was a crowd, so I didn't rush setting it up. We each took turns
fondling the iMac as we
casually talked about the Mac, Apple's comeback, etc. I overheard an
Epson rep marvel that
Apple's marketshare doubled by with the iMac alone. The Canon rep asked
if she could demo
their new all-in-one machine tomorrow. One customer worried aloud about
Apple's ability to
supply the iMac channels adequately. I reassured him that we'd have
plenty iMacs, it being the
company's cashcow and all. He was pleased that the Mac section had such
confident and
Mac-knowledgeable people, to which I said, "Aw, shucks"

I plugged in the power cable and turned on the iMac. I intentionally
didn't plug in the mouse and
keyboard so the customers could see me plugging them in after turning
the power on Ah the
user-friendliness of USB!

I inspected the iMac. Did you know that you do not need the paperclip
anymore? I said aloud.
The iMac now has the reset buttons (near the USB and FireWire ports)
just like the B/W G3 has.
Now, I could have just overlooked the pinholes, but it would be
redundant now, right?

I noticed that there was no door covering the ports (USB, FireWire,
ethernet, etc.) like on
previous models. I inspected the back door where you access the RAM
slots, but didn't open it
(must save something for tomorrow).

Next, I pulled out the DVD copy of "A Bug's Life" that came with the
iMac. I installed it and noticed
that it was DVD ran on version 2.0b4 (or something like that) of the DVD
software. Turing the
movie, I was pleased that the speakers sound so much better than the
previously tinny ones.
Even so, I still plugged in a set of Cozo speakers. I inserted and
ejected the disk several times to
see how the front-loading slot worked. Sweet.

I then installed iMovie, the digital-video-editing software that comes with the iMac. After that, I went to help a customer, and when I got back, one of my friends had a crowd around him. He was amazed at how easy to use the software was. I'd installed the 160 MB iMovie demo files that he was using. He'd edited a video about a dog and a family by adding a transition to two scenes. Without a manual. We noticed that the application only plays with Digital Video -- in other words -- only for FireWire equipped Macs. We figured that all FireWire-equipped Macs will come with the program in the future, then.

Personally, I think the graphite color was too transluscent (and a customer agreed with me). I mean, you could see virtually every part of the computer's innards. Ironically, it was also cool at the same time. I can't quite explain it. I noticed on the boxes (which have new artwork, also) that the other iMacs appeared to be not as transluscent as the graphite-colored one.

To be honest, I'd have a hard time deciding which one to buy.

Overall, the machines are works of art -- moreso than the original iMacs. I think Apple will sell far more of these than the previous models. And I honestly believe that each of them is a big deal for the money -- even the high-end iMac DV SE. The Wintel world erroneously believes that the secret to iMac's success is merely color (take a look at the eOne when you get a chance -- I did was not impressed at all). The iMac is a total package; a totally integrated package. This is not Apple cheerleading. I went and looked at the PCs in the store and the Apple lineup beats them all, hands down.

Now, I could have given you a more formal, "professional" review of the iMac. But it doesn't take formality to tell you that you should buy one of these beauties if you are on the market for a new computer.

The current crop of iMacs are the Macs that most of us were waiting on, back when we felt that something was missing from the iMac. You won't have that feeling after test driving one this go round.

Proof, pudding, eating

As I set up the iMac, one customer who was there for a while, talking and watching, decided to
buy one. I went to get a blueberry model for him "for his daughter's birthday" on October 26
(remember that today is October 8). I joked that his holding the computer that long would be like
the fat kid being assigned to watch the candy stash, suggesting that he'd "play with" the iMac so
much before giving it to his daughter that it would no longer look new. After some thought, he
decided not to buy the iMac that I'd brought out for him. So I took it back -- and I brought out the
graphite iMac, per his suggestion. I wonder if it is still "for his daughter."

It was a great night. We spent more time than we'd planned playing around with the iMac and
the G4 (which is a story for another column unto itself). Technolust reigned supreme.

Oh, and remember that comment at the beginning about not being in a rush to buy an iMac? That
is no longer true. Because now that I've played with it myself, all I can say is one word:
"sweeeeeet."

She is going to need to allocate upto $1000 for a decent system and that
would not be unreasonable. Even Apple has an official $999 iMac now and
that includes 64 MB, 6 G's, 128 Rage/2x AGP and a nice software bundle.

> > On the older boxes...Would have to wait for the cursor to catch up..Plus

This post only proves the fact that iMac's are aimed at the newbie and bubblegum market. Not a bad market to aim for though, there are a lot of clueless people around.

FYI, the USB design patents lists the Amiga A4000 hardware manual as a reference. Hmmm, go figure.

Gee, they finally figure out how to properly implement a true plug 'n' play technology and they needed to research an old Amiga manual to do it...

Why doesn't that surprise some of us...

Page formatting speed isn't that much of an issue. The speed at which
the data comes down the line is more often the deciding issue. Most
people use 56k modems, and traffic can make the some of the bandwidth
available in a 56k redundant at times...

> Many will surf the web. Lets face it, the web has changes society on how
> we function. If you think the Atari 8 bit will be all you need...I have
> a bridge to sell..

These societal changes you speak of are not as all consuming as -MOST-
web users would admit they are. Sure we email other people, and surf
the web, but people don't function much differently from what they did
10 years ago or 20 years ago...they just send email instead of writing
letters...

iMacs are quite expensive here ($2999NZD, equates to $1550 but with a low-spec
printer as well), and PC's, while cheaper, are tending NOT to be bundled with
a full suite of Word, Excel, etc...

She doesn't want to pay that much money for a computer, and then have to pay
quite a bit more to get the software...as I said an older Pentium with 14-15"
screen, 133-200Mhz CPU, 16-32MB RAM, and Win95, with Word95 and Excel95
can be
had for US$200 here...why should she want more?

> > > On the older boxes...Would have to wait for the cursor to catch up..Plus

> For you and not the millions who have home offices such as myself..Quit
> assuming that you know whats best for all.

I'm well aware whats best for all. For a busy home office a system that is quick and easy to use, as well as reasonably capable, is the ticket. For a novice home user like my partner, who isn't using her system to run a business , a slower 2nd-hand machine is fine. For myself, a combination of my Falcon030 and a 200Mhz PowerMac is more than suitable, especially the Falcon, as my computing interests are not the mainstream business apps I see most people struggling with in the home environment, but 'fun' software like APEX media. I also use Adobe/Epson ColorIt!, Photoslop, D2D software (mainly on Falcon!, 200Mhz 603e doesn't really cut it for D2D!), and the odd game demo. I cannot be bothered to buy games because I don't really get enough time to play them fully. So sorry, I don't quit now...

> > BTW, with your knowledge of macs, do you know of a mac app that will play
> > 16-bit FLIC animations (.FLH) as created by Autodesk Animator and APEX
> > media?
>
> Macromedia Director, Media Cleaner Pro, Ray Dream, Poser, Bryse etc...

I'm not sure you are correct in handing me this list. Quicktime does not recognise the 16-bit anims, although a PC with Autodesk Animator did a while ago, even though it couldn't play the thing because it was limited to 256 colour anims. It at least recognised what the file was...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sounds like sour grapes here..."Who needs G4 processors and cutting edge
apps thats why I love Amiga..."

Tell me were can I buy a brand new G3/350 Amiga with 64 MB, 6G, 2xAGP/128
Rage, Harmon Karden Speakers, screen and software bundle for $999. Plus
has a future running OS9, OSX client beyond. No need to run inferior net
apps on this platform...

```
JET MOTO 3
THE RUSH IS BACK!
```

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You'll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics☐, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
☐ Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings for acceleration, top speed and handling.
☐ All-new 3D racing engine with MotoPhysics☐ delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
☐ 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
☐ Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
☐ Experience realistic weather effects including snow, rain and night racing.
☐ Challenging AI jostle and fight for position by crowding or side-swiping other players.
☐ Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

```

If a page is loading that slowly, it's the pipe that's the
bottleneck,not the PC. I can personally attest to the fact
that lowend Pentium class hardware can infact keep up
with a T1 connection. Never mind a serial modem.

You're just full of it.

My Atari 800 doorstop might not be adequate but, certainly
a $100 machine from Computer Renasiance or a $300 machine
from the web will most certainly do.

[deletia]
>> which to hone the skills she learnt on the course. A basic older Pentium

This is bullshit, spread primarily to make overpriced Mac
hardware look good. 64M is meagre, the Rage 128 is the
lowest performer in it's class and 2x AGP for bargain bin
machines.

>would not be unreasonable. Even Apple has an official $999 iMac now and

Even a discontinued Pentium, HELL a 486 will happily do OLE
object imbedding. I did just that on my 486DLC in college.

A desktop Sparcstation simply isn't required.

No arguement there, it would be foolish to suggest otherwise.

That doesn't change the facts on the market the iMac is aimed at, or the
A4000 patent reference for USB however.

Regards,

Clockmeister.

http://www.digitalproducer.com/aHTM/Articles/10_11_99/avid_systems_dominate_tv.htm

---
From "Digital Producer" magazine:

96% Of Fall '99 Primetime Television Shows Edited On Avid Systems --
101 of 105 Primetime Fall TV Shows Cut on Avid Media Composer/Film
Composer Systems; Several Shows Make the Leap to Nonlinear
Finishing with Avid Symphony --

TEWKSBURY, MA., Oct. 13--Avid Technology, Inc. announced that 96% of
primetime television
shows this fall are being edited using the Avid Media Composer and
Avid Film Composer
systems, and a number of shows have taken the next step in nonlinear
television post production
by finishing on the company's new high-end Avid Symphony system. 101
of 105 (1) shows in the
1999-2000 fall primetime television lineup -- including David E.
Kelly's `98-99 Emmy-winning
Best Drama "The Practice" and Best Comedy "Ally McBeal," as well as
`98-99 Emmy recipients
in the editing category, "The Sopranos" and "Sports Night"-- are being
cut on Avid's
industry-leading Media Composer or Film Composer systems. Popular
returning drama
"Profiler" and `98-99 Emmy winner for animation "King of the Hill" are
set to online their seasons
using the Avid Symphony system.

Uh.. TIFKAS? Just exactly how many network TV shows are shot and edited
on DV? Er.. that would be none!

Yep.. Avid is shakin' about this FCP business.. yep..

It's just too easy to make you look uninformed.. not even a challenge.

You may be thinking of Datalite 2. I used the program years ago and it
seemed to be reliable and fast enough (on a TT, I don't know what it would
be like on an ST). Unfortunately it didn't work with other not FAT
filesystems under MiNT. Since then I no longer have a lack of hard disc
space so I have never tried to use it again.

The best thing you could do is simply buy a larger hard disc drive.

Author:
Psylocke <Psylocke@Xavier.com>
Posting History

On Thu, 16 Sep 99 01:14:08 -0700,
Terry_Palfrey@mindlink.bc.ca (Terry
Palfrey) was overheard babbling midlessly :

>As for your criticisms Jack, admit it, you are
simply a
simple
>tool user. Don't try to claim "Amigan". You
weren't. You
simply
>used the machine in a stock config with an
extremely
specialised
>painting card. You never modified or updated
it.

I also originally ignored your rather ignorant
post to me about
not being an Amigan.

Pray tell who died and made you GOD? way I see
it you are a
ranting idiot, and a clueless one at that.

You Terry are no Amigan. and that pretty much
applies to most
of the people here as well. Few if any here are
really true
Amigans.

I am more Amigan than you will ever be.

Amigans were people who pushed the limits and made great
effort to be the biggest and best at everything. Images, music,
demos etc. Amigans did not settle for second best. Amigans made
their own hacks to expand their a1000's to have more
memory, magazines covered articles on how to hack the
hardware. They pushed the edge when it came to just about
everything.

An Amigan did not SETTLE for second best.

A TRUE Amigan would not settle for the fact that Amiga cannot
take advantage of the majority of the simple internet
STANDARDS that every other computer on the market can take
advantage of like HTML 4.01, Flash, Shockwave, Real Audio
and a lot of others.

deluded nut cases like Steve Giovanella can sit around and blab
all day about how ImageFX can FINALLY animate now and cost 3
times what Paint Shop Pro does, and babble on about how fast
the Amiga boots and yet has little software available for that
very expensive PPC card he bought.

I'll clue you in on a few things right off.... You think PPC is
some great triumnph? dream on. PPC is a dead end and
everyone knows it.

Do you truly believe P5 will have that promised AmiRage
anytime in the near future? not this year thats for sure.
probably not next year either.

Why? Apple cannot get G4 chips, what makes you think P5
can? it is not going to happen. plain and

simple. Of course that
means that the P5 cards they promised with G4
and Neutrino
will not be shipping anytime soon either.

TRUE AMIGANS would not tolerate this crap.

TRUE AMIGANS would not have acted like the
desperate fanatics
that everyone did when the iWin hoax started.
Frankly I though
it was pathetic to see people all excited over
the promise of
decade old technology being repackaged and sold
for premium
prices. The posts that followed iWin were
nothing short of
pathetic.

>And since CSAA is my hangout, I'll take that
comment you
made
>quite seriously as a true indication of your
real feelings.

A typically arrogant bit of nonsense from you,
and not
particularly unexpected. CSAA is not YOUR
domain pal. It is
free to anyone who wants to post here. If you
don't like then get
therapy, because you are getting delusional
here.

Your judgemental attitude and labeling of
people who YOU
consider is Amigan or not is pretty lame. I got
news for you,
you do not decide who is an Amigan or not. It
is just that
simple.

why...Look to see more fire sales at Avid...

Avid Technology Announces Third Quarter Results and Senior
Management Changes

- CEO and President resign; Company to deliver restructuring
plan in 30 days -

TEWKSBURY, Mass. (October 20, 1999) - Avid Technology, Inc. (NASDAQ:
AVID) today announced financial
results for the third quarter ended September 30, 1999 as well as
certain senior management changes and its intention
to significantly restructure its business.

Third quarter 1999 revenues were $113.3 million compared to $116.2
million in the third quarter 1998. For the third
quarter of 1999, the Company recorded a net loss of $13.1 million, or
$0.56 per share, which includes amortization of
acquisition-related intangible assets. Excluding the acquisition-
related amortization, the Company recorded a
tax-effected loss of $1.4 million, or $0.06 per diluted share,
compared with net income of $8.0 million, or $0.30 per
diluted share, in the same quarter a year earlier.

For the nine-month period ended September 30, 1999, revenues were
$340.9 million versus $337.8 million in the
same period in 1998. For the nine-month period ended September 30,
1999, the Company recorded a net loss of

$32.6 million, or $1.36 per share. Excluding acquisition-related amortization and non-recurring costs, net income was $4.0 million, or $0.15 per diluted share, compared to $25.0 million, or $0.99 per diluted share, for the same nine-month period in 1998.

The company also announced the resignations of its Chairman and Chief Executive Officer William J. Miller and President and Chief Operating Officer Clifford A. Jenks. On an interim basis, Chief Financial Officer William L. Flaherty has been named Acting Chief Executive Officer. David Krall, who is currently Chief Operating Officer at Digidesign, Avid's professional audio business, has been appointed Avid's President and Chief Operating Officer and will lead the restructuring effort. The company also announced that the Board of Directors has initiated a search for a permanent Chief Executive Officer, which it hopes to complete within three months.

Mr. Miller said, "I am proud of what we have accomplished at Avid during the past several years, but the fact is that our plans to grow the business have not been successful. As Avid seeks to reshape itself for the future, it is appropriate that new leadership take on that task. I wish them well in that effort and look forward to Avid's future success."

Said Mr. Flaherty, "Avid embodies numerous strengths as a recognized leader in digital content creation tools and media management with exceptional products and valuable proprietary intellectual property and technical expertise. The goal of our restructuring effort will be to channel these strengths into our strongest market opportunities with an infrastructure that supports a realistic and profitable business model as we enter the year 2000."

He added, "Our performance to date in 1999 has obviously been a disappointment. Our market realities have been changing rapidly, making our current business plan increasingly difficult to achieve. The Board believes that a thorough restructuring is necessary to position the company for future growth and profitability."

Mr. Krall noted, "We plan to closely examine all aspects of our business as part of this restructuring effort to align expenses with revenues and continue to invest in areas for future growth. It is critical to ensuring the company's on-going success, and I intend to work closely with our Avid team in developing an effective plan within 30 days. We are committed to achieving the results this company can produce, for the benefit of our customers, employees and shareholders."

Mr. Flaherty joined Avid as Chief Financial Officer in September 1996. He has previously held senior finance positions at Gibson Greetings Inc., FMR Corp., the parent company of the Fidelity Investments Group, and Du Pont.
He holds an AB degree from Dartmouth College and an MBA from the Amos Tuck School of Business
Administration at Dartmouth.

Mr. Krall brings a strong technical background to his new position, as he holds BS and MS degrees from the
Massachusetts Institute of Technology. He has held his current position with Digidesign since May 1998. He joined
Avid Technology in May 1995 as Digidesign's Director of Program Management and later served as Digidesign's
Vice President of Engineering. He also holds an MBA from the Harvard Business School.

Third Quarter Results Commentary
"During the third quarter, we ran an aggressive promotion of ABVB-based Media Composers as part of our
Macintosh initiative," Mr. Flaherty said. "This resulted in increased Mac-based Media Composer sales versus the
prior two quarters, but it adversely impacted gross margin and was a principal contributor to the quarter's operating
loss."

He added, "Our balance sheet remains strong. We continue to generate cash and ended the quarter with cash and
investments of $83.1 million, up slightly from $82.5 million at June 30, 1999."

The above includes forward-looking statements based on current expectations that involve a number of risks and
uncertainties. Actual results may differ materially from those described therein, depending on such factors as are
described under "Certain Factors That May Affect Future Results" in the Company's Annual Report on Form 10-K
for 1998 and Quarterly Report Form 10-Q for June 30, 1999, filed with the SEC.

"The iMac has been the biggest computer launch we've seen in our history. Apple is back, and iMacs are flying off CompUSA store shelves
across the United States."
James Halpin, president and chief executive officer of CompUSA

nope, he used DejaNews, known far and wide as an excellent search engine for finding old Internet posts, but its posting facilities are substandard especially regarding cut and paste. It's known by many Internet experts as basically training wheels for the Net clueless before they graduate to REAL newsreaders (which on the Mac includes the excellent MT Newsreader).

Of course, seeing as TiFKAS doesn't have two rocks to rub together for brains, he's perfectly incapable of setting up a real newsreader for plopping down his steaming piles of drivel. His inability to spell is well proof of that.

Besides, he'd hurt himself on an Etch-A-Sketch(tm) :)

Guess TiFKAS succumbed to another brain fart, now that the Steve Jobs Reality-Distortion Field(tm) is crumbling around him what with the events of the past month (Apple cancelling G4 orders, trying to get the Apple fans to re-order for $1000 above the original selling price, then reversing themselves once they realized they were setting themselves up for another lawsuit, introducing a 350mHz G4 (which is BELOW the original G4 specs, looks like a lot of chip failure on the assembly line!), the discovery that the not-ready-for-prime-time Final Cut Pro WON'T RUN on the new DV iMac (which Apple has admitted, but won't allow discussion of on their web site), Avid is REALLY QUAKING IN THEIR BOOTS about this, Apple caught crippling G3 computers so they won't take third-party G4 upgrades...

all of this was found on comp.sys.mac.advocacy, the place TiFKAS is too chicken to post willingly to, due to the fact that not only that he hates scrubbing off scorch burns, but the fact that the knowledgable Mac fans will quickly unmask him as a poseur pretending to be an "Apple Power Rep"...

gee, what with all this, Apple's Board Of Directors may soon be Thinking Different, decide that they're paying uberboss Jobs a dollar too much, and wind up throwing his head to the stockholders...

OH MY.. even for YOU this is incredibly stupid.

Do you THINK for a moment that the MAJOR studios shop for their NLEs (non-linear editors) by what's on SALE!?!? What a moron.

Yea, they're going to base their decisions on whether they can save a few grand..

:)

Man you are dense.. another brilliant retort that further shows how ill-informed you are.

It's better to keep your mouth closed and be thought an idiot then to open your mouth and remove ALL doubt.

What happened is that they could not get 500mhz G4 chips from Motorola.
Were down to two models from here. The 350 G4 is in plentiful supply.
All they did was reduce the clock speed by 50 mhz for the same

configurations. They did reverse and those who ordered prior to Oct. 13
will get their machines as promised. Could they have handled it better?
Yes.. To bad Atari did not honor their contracts with their dealers and
developers while stealing the 'handy' from Epyx...

FCP runs fine thank you..

A certain 68k Jihad claimed it was too late for Apple to release new
Milan crunching G3 iMacs for the Christmas quarter. Once again the chunky
soup turns cold while Apple's worldwide manufacturing will churn out tens
of thousands per week of these awesome sucessor to the popular iMac..

Your kidding right?

"The iMac has been the biggest computer launch we've seen in
our history. Apple is back, and iMacs are flying off CompUSA store
shelves
across the United States."
James Halpin, president and chief executive officer of CompUSA

That won't help. Your etchasketch cut and paste even
looks lousy in 132 columns.

why do you keep bringing up your imaginary friend "Chunks" into it? Or are you getting completely delusional?

The Simpsons have said many more things of intelligence and wit than our sorry friend TiFKAS. Or is it that TiFKAS is jealous of the fact that Matt Groening will be remembered as a legend, while he will be completely forgotten?

ah, showing again your extreme ignorance, eh, TiFKAS? I'm working in eighty columns here.

and it's obvious that you don't review your work after putting up your brain-dead posts, for you would see that your cut-and-paste work was smeared all over the screen, thereby ruining the effect you were attempting.

TiFKAS is still stuck in 1989 - just like the basis of the MacOS....

gilding the lily, eh, TiFKAS. Apple said themselves that anything below
350mHZ would not be suitable for their G4 machines, and Motorola was going
to use them for imbedded devices for other manufacturers. When the 500mHZ
turned out to be defective, and it appeared that there wouldn't be any G4s
unless something was done, Apple must've had to swallow hard to release a
new machine that was below the lofty standards they set.

They did reverse and those who ordered prior to Oct. 13
> will get their machines as promised. Could they have handled it better?
> Yes..

to begin with, they should've made sure the machines worked before
announcing them. Jobs has egg on his face as he should.

To bad Atari did not honor their contracts with their dealers and
> developers while stealing the 'handy' from Epyx...

again, TiFKAS gets it wrong. Atari did not "steal" the Handy, they
bought the rights to it from Epyx when it was obvious they couldn't afford
to market it on their own...

>
> FCP runs fine thank you..

no it doesn't....

from www.macintouch.com (an Apple news web site who won't kiss Jobs' ass)

Dennis Csillag reports Final Cut Pro incompatibility with the new iMac DV (and
Apple's lack of interest in discussing it):

"I was interested in using FCP with the new iMac DV's, so I went to Apple's
Final Cut Pro Forum. There were already a few questions there about the issue.
Apple's response was that FCP is not certified for iMacs. When I pointed out
that the DV iMacs fit the system requirements (Processor, Monitor resolution and
Firewire i/o), my post was deleted and I got the message that 'questioning
Apple's decisions or future releases) is not appropriate for this forum.'

what colour is the sky in your world, TiFKAS?

>

hmm, there's no proof there that you're an Apple Power Rep, POSEUR. Or
did you come up with that web site while using the free web service at
your local library?

again, name of business. name of supervisor. number where he can be
reached during the day. Not doing so only proves what a coward you are.

>
> > gee, what with all this, Apple's Board Of Directors may soon be

> > much, and wind up throwing his head to the stockholders...
>
> Your kidding right?

were you kidding when you said that if Jobs got back in he would
completey destroy Apple, and that he was an arrogant bonehead? well guess
what, you were right there - announcing new computers before they were
even tested to make sure they worked is the mark of a true bonehead.
Announcing new computers before they could ensure a plentiful supply is
the mark of a bonehead. Trying to cancel orders of computers the company
couldn't supply, then trying to make the suck^^^^^customers to re-order
the same computers at $1000 more and not expecting a firestorm is the
supreme act of arrogance, and the supreme definition of bonehead.

of course, since TiFKAS fits the description of a blindered BOZO
(Bitter Obstinate Zealot Order), he continues to apply tongue to boot
leather, indeed he seems to have acquired a taste for shoe polish...

I thought that 1024*768 did support 80 column. You must have turned
your knob the wrong way.

Who cut out the blow me? Dickhead.

4385. New Atari Sales Area fcrom 16/32

Newsgroup: comp.sys.atari.advocacy
Date: 1999-10-23 00:00:00 UTC
From: Nick Harlow <nick@1632systems.co.uk>
Message-ID: <7usoff$39$3@plutonium.compulink.co.uk>
Source record: 2748

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At the moment we have a basic catalog set up and will be expanding on this every day, we plan to publish articles, help files in a general area as well. I would like to make this a first or even second stop for Atari Users. The catalog at moment is fully useable and if you wish to order then please do so. Whilst we are knocking this area in to shape we will confirm each price before sending.

However I require input, please browse pages as they come if you wish and let me know what you would like to see either available or as general interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or nahrlow@cix.compulink.co.uk

Thanks for your time

Nick Harlow

My tools are NetScape 4.6.1 and Internet Explorer 4.5. What 1984 tools
do yoy use?

Atari paid dirt cheap for it and squeezed Miner and his partner..Plus I
thought you were a socialist?

> >

Graphite...My name is on one...Na..the new $999 BB iMac/350 will do to
complement my work PB G3. What's the latest on Milan? Has it gone from
50 to 55 units a month?

I did not say he was an arrogant 'bonehead' your words...I was
wrong...Get over it...

Were you not wrong when you stated that it was too late to release the
new iMac DV's at this time? Just someone who thought that Apple's
manaufacturing division was the size of Atari's manaufacturing garage..
